vii Course Overview

1 Unit 1: A Day in the Life of the Service Agent

3	Lesson: Identifying the Features and Processes of SAP Service Cloud
9	Lesson: Performing Daily Tasks
13	Exercise 1: Use Search
15	Exercise 2: Use Favorites
17	Exercise 3: Edit Account Details
21	Exercise 4: Personalize your Home Page
23	Exercise 5: Remove a Field
27	Exercise 6: Prioritize Service Tasks
32	Lesson: Configuring SAP Service Cloud
33	Exercise 7: Use Adaptation to Hide a Field
37	Exercise 8: Create a Mashup
41	Exercise 9: Select Features with Scoping
43	Exercise 10: Use Fine Tuning

51 Unit 2: Manage Customer Interaction

52	Lesson: Managing Customer Interaction
55	Exercise 11: View a Service Level Agreement
59	Exercise 12: Accept an Incoming Call in the Live Activity Center
63	Exercise 13: Use the Solution Finder with a Knowledge Base
67	Exercise 14: Escalate a Service Ticket
72	Lesson: Configuring Customer Interaction
75	Exercise 15: Configure the System to Handle Phone Calls
79	Exercise 16: Configure Email Communication
81	Exercise 17: Configure Email Response to Customer
85	Exercise 18: Configure a Web Service for a KB
87	Exercise 19: Configure a Data Mashup for a KB

95 Unit 3: Configure Ticket Routing

96	Lesson: Automatically Assigning Tickets to Service Teams
97	Exercise 20: Create a Work Distribution Rule
100	Lesson: Using Service Level Agreements
101	Exercise 21: Use a Service Level Agreement

107 Unit 4: A Day in the Life of a Field Service Technician

108	Lesson: Performing a Service Call
111	Exercise 22: Assign a Work Ticket
115	Exercise 23: Complete a Site Visit
118	Lesson: Configuring the System to Allow Time Recording
119	Exercise 24: Configure Access to Time Recording
121	Exercise 25: Configure a Service Product for Time Recording

127 Unit 5: Manage Objects to Support the Service Process

128	Lesson: Using Installed Bases and Registered Products
131	Exercise 26: Create a Registered Product
135	Exercise 27: Create an Installed Base
139	Exercise 28: Add Registered Products to an Installed Base
142	Lesson: Using Maintenance Plans
145	Exercise 29: Create a Maintenance Plan
147	Exercise 30: Schedule a Maintenance Plan
151	Exercise 31: Create a Recall Campaign
154	Lesson: Managing Warranties
157	Exercise 32: Configure the System to Allow Warranties
159	Exercise 33: Grant Access to the Warranties Work Center
163	Exercise 34: Create a Warranty and Assign to a Registered Product

Course Overview

TARGET AUDIENCE

This course is intended for the following audiences:

- Application Consultant
- Business Analyst
- Business Process Architect
- Business Process Owner/Team Lead/Power User
- Trainer

UNIT 1

A Day in the Life of the Service Agent

Lesson 1

Identifying the Features and Processes of SAP Service Cloud	3
---	---

Lesson 2

Performing Daily Tasks	9
Exercise 1: Use Search	13
Exercise 2: Use Favorites	15
Exercise 3: Edit Account Details	17
Exercise 4: Personalize your Home Page	21
Exercise 5: Remove a Field	23
Exercise 6: Prioritize Service Tasks	27

Lesson 3

Configuring SAP Service Cloud	32
Exercise 7: Use Adaptation to Hide a Field	33
Exercise 8: Create a Mashup	37
Exercise 9: Select Features with Scoping	41
Exercise 10: Use Fine Tuning	43

UNIT OBJECTIVES

- Identify an example case for using SAP Service Cloud
- Describe the Features of SAP Service Cloud
- Recognize the Customer Service Process
- Name the Steps of the Field Service Process
- Navigate the User Interface
- Use Personalization
- Determine the priority of service tasks
- Identify the daily tasks of the business user
- Perform adaptation tasks

- Create a mashup
- Perform scoping tasks to configure SAP Service Cloud

Identifying the Features and Processes of SAP Service Cloud

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Identify an example case for using SAP Service Cloud
- Describe the Features of SAP Service Cloud
- Recognize the Customer Service Process
- Name the Steps of the Field Service Process

Business Case: Aspen Bicycles

This company is fictional and could be located anywhere around the world, but for example purposes, let's locate it in Denver, Colorado, USA.

Aspen Bicycles, is a fast growing company and has been manufacturing high quality bicycles for all ages for over twenty years. However, now, with a growing global market, they need a robust tool to replace their legacy systems. SAP Cloud for Customer is a perfect fit for both sales and service.

In addition to bicycles, Aspen also manufactures high-end, durable and world class fitness equipment that can be found in hotels, colleges, corporate offices, public gymnasiums, and many other establishments around the world. Some of their most popular lines includes a stationary bike called the X1000. In addition to being a durable and reliable machine ideal for fitness center use, the X1000 is connected via the internet to allow for online competition. These machines are also able to call for service/maintenance automatically after predefined time intervals or hours of usage (IOT).

These machines are made to take a beating, but they need regular maintenance to keep their performance at top condition, so their users can stay in top condition!

One of Aspen's most important customers is Stillton Hotel Group, a global hotel chain based out of Seattle, Washington in the USA with locations in most cities around the world. Stillton has purchased a number of X1000 stationary bikes to install in their fitness centers in Brussels, Berlin, and New York.

SAP Service Cloud Features

SAP Service Cloud is a powerful tool designed to optimize your service-based customer interactions.

First of all, SAP Service Cloud is fully integrated with SAP Cloud for Customer and uses the same account base*. You and your administrators can easily configure automated communication with your customers through any channel, deliver preventive and repair services to your customers from start to finish, provide customer-facing self service support tools, and much more.

Note:

* SAP Cloud for Customer is actually two fully integrated solutions: SAP Service Cloud; and SAP Sales Cloud. They are both handled in the same UI and also use the same account base, but each solution needs to be licensed individually. This course is about SAP Service Cloud.

SAP Service Cloud is a feature-rich application with many capabilities. Your organization can decide which of these you would like to implement, so your customers get the features they expect.

Omni-Channel Service

First, omni channel service means you can configure your choice of many communication channels, including email, phone, chat, Internet of Things, social media channels such as Facebook and Instagram, and many more.

Collaboration

SAP Service Cloud also easily integrates with social collaboration tools such as SAP Jam, and allows you to include the feed directly in the user interface

Solution Finder

The Solution Finder allows you to integrate with a knowledge base such as SAP Jam or your existing knowledge base to provide context-sensitive recommendations and easily share this content with your customers.

Analytics

SAP Service Cloud comes with pre-built dashboards and analytics to evaluate handle times, priority and escalation trends when needed.

Productivity Tools

An extensive collection of Productivity tools includes email response management, routing and escalation rules, workflow notifications and approvals, time recording, and much more, all of which can be configured during implementation to meet the needs of your business.

Personalization

Users can easily personalize SAP Service Cloud by flagging records, setting favorites, adding records to a personal shelf, and creating user defined fields.

Mobility

Mobility feature allow your service technicians to easily access and update service tasks in the field on just about any mobile device. Service techs working in remote areas can even access their data in offline mode.

Integration

Finally, SAP Service Cloud integrates easily with your other SAP applications, with native integration with SAP S/4HANA, SAP FSM (Field Service Management), SAP SuccessFactors Employee Central, and many more. Plus, an open API console allows custom integrations with third party systems.

Animation: Service Cloud Features at a Glance

For more information on *Service Cloud Features at a Glance*, please view the animation in the lesson *Identifying the Features and Processes of SAP Service Cloud* in your online course.

The Customer Service Process

Select each step to learn more about the customer service process.

Animation: Customer Service Process

For more information on *Customer Service Process*, please view the animation in the lesson *Identifying the Features and Processes of SAP Service Cloud* in your online course.

The Customer Service Process comprises 5 steps.

1. The customer service process is triggered when incoming communication is received from the customer.
2. Processing starts after first contact. This can be done manually or automatically based on the type of customer communication.
3. Resolving the issue is the most important step. Repairing or replacing the item that the customer reported is the goal.

4. After resolution, the system can initiate communication to verify the issue is resolved. This could be done by a survey, phone call, or email.
5. Closing is the last step in the Customer Service Process. During this step, the ticket is closed following acceptance by the customer. This is also the time to review reports and analytics to make sure tickets are being resolved in a timely manner, and use this feedback to determine if the process can be improved.

The Field Service Process

In many cases, tickets cannot be resolved remotely, and the company will need to send out a Field Service Technician. This initiates the field service management process.

1. The first step in this process is to identify the customer's needs: whether the maintenance is planned or preventative; or reactive or corrective.
2. Before the Service Technician conducts a service call, they prepare by validating what needs to be done and determining what will be required. This may include ordering a replacement part from inventory.
3. Now it's time to take care of logistics. This may include having the customer send in an item for repair, or scheduling a field service visit.
4. The work can then be performed, either onsite or at a repair depot.
5. Finally, the wrap up consists of confirming with the customer that the repair has been performed to their satisfaction and that the original issue has been resolved. The wrap up phase is also where the service technician logs their time spent on the repair.

Select each step to learn more about the field service management process.

Animation: Field Service Management Process

For more information on *Field Service Management Process*, please view the animation in the lesson *Identifying the Features and Processes of SAP Service Cloud* in your online course.

LESSON SUMMARY

You should now be able to:

- Identify an example case for using SAP Service Cloud
- Describe the Features of SAP Service Cloud
- Recognize the Customer Service Process
- Name the Steps of the Field Service Process

Unit 1

Lesson 2

Performing Daily Tasks

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Navigate the User Interface
- Use Personalization
- Determine the priority of service tasks
- Identify the daily tasks of the business user

The SAP Service Cloud User Interface

SAP Service Cloud for Customer has an easy to navigate user interface, starting here on the Home screen. There is a navigation pane on the left, comprising a customizable list of Work centers.

Select a Work Center to then select a View within it. For example, the Service work center and Tickets view. The View user interface has a summary and detail pane in the center, and a toolbar on top right. All visuals are consistent with the SAP Fiori user interface. The figure above shows the location of Work Centers and Views, Filters and Productivity Tools.

There are several ways to search for records in the user interface.

The fastest is to use the Search field magnifying glass icon which allows a quick search on a single field in your list.

If you need a more detailed search, the Advanced Search funnel icon opens a window in which you can enter multiple criteria in multiple fields.

Finally, each work center has a query dropdown list with a number of preset queries. You can also create and manage your own queries and add them to this list.

If you hover over a record when viewing it, the Quick View displays to show key information before you open it.

Notice the icons at the top of the Quick View. You can choose the star to mark the record as a favorite, or choose to flag, or to follow it.

Personalize the Home Page

The screenshot displays the SAP Service Cloud Home page for a user named Sabine Hoover. The page features several widgets: 'Feed', 'My Upcoming Activities', 'My Tasks', 'Unassigned Tickets' (0), 'My High Priority Tickets' (6), 'My Queue' (9), 'Tickets Escalated To Me' (2), 'Tickets Assigned To Me' (9), and 'My Team Queue' (0). A yellow arrow points from the top right of the Home page to the user profile menu. The menu includes options like 'Settings', 'Report Incident', 'Track my Incidents', 'Switch Display Mode', 'Download', 'Annotate', 'Start Personalization' (highlighted with a yellow box), 'Share Your Ideas', and 'About'. At the bottom of the menu are 'Help' and 'Sign Out' links.

- Enables individual users to modify their own view of screens.
- Impacts only the user making the change to a screen.
- Allows users to tailor the system for individual needs

Figure 10: Personalization

Personalization refers to the ability of business users to customize SAP Service Cloud to meet their individual needs. Any changes made in personalization do not affect other users.

Some of the changes a business user can make using personalization include modifying the widgets, such as Feed, My Tasks etc., visible on the Home screen and adding or hiding fields.

Personalize your Home Page

Personalize your Home Page

Simulation: Personalize the Home Page

For more information on *Personalize the Home Page*, please view the simulation in the lesson *Performing Daily Tasks* in your online course.

Remove a Field

Remove a Field

Simulation: Remove a Field

For more information on *Remove a Field*, please view the simulation in the lesson *Performing Daily Tasks* in your online course.

Determine the Priority of Tasks

1. Check assigned tickets
2. Check escalated tickets
3. View service call status

The service agent will use SAP Service Cloud to ensure that all customer issues are addressed quickly and appropriately. Let's look at an example of how the agent may start their day by prioritizing service tasks using the customizable home page, which contains several widgets, such as Feed, My Tasks etc., that show assigned and escalated tickets.

Using the user interface, the agent may start by checking any tickets assigned to them, followed by any tickets that have been escalated, to make sure they are being resolved according to their order of importance.

They can then view the status of the service calls they have scheduled to ensure that they are taking place as planned.

Finally, they can check for any updates on their customer data, as well as any newly registered products, installed bases and warranties.

Prioritize Service Tasks

Prioritize Service Tasks

Simulation: Prioritize Service Tasks

For more information on *Prioritize Service Tasks*, please view the simulation in the lesson *Performing Daily Tasks* in your online course.

Prioritize Service Tasks

Prioritize Service Tasks

Simulation: Prioritize Service Tasks

For more information on *Prioritize Service Tasks*, please view the simulation in the lesson *Performing Daily Tasks* in your online course.

Perform Daily Tasks

The screenshot displays the SAP Service Ticketing interface with a list of daily tasks on the left and a dashboard on the right. The tasks are:

- Review tickets from the previous day
- Check for incoming tickets
 - My Queue
 - My Team Queue
- Take customer calls and create new tickets
- Resolve issues when possible
- Schedule field service
- Close tickets in a timely manner

The dashboard on the right shows the following ticket counts:

My Team Queue	Tickets Assigned To Me	My Queue	Tickets Escalated To Me
0	9	9	2

Below the counts, there is a search bar and a list of tickets. One ticket is highlighted: "102 - Stationary bike". Its details are:

- Escalation Status: Not Escalated
- Assigned to: Sabine Hoover
- Service Technician: [Name]

Figure 12: Performing Daily Tasks

A service agent's day consists of any tasks that contribute to a first-class service experience for their customers. This may include:

- Reviewing and prioritizing outstanding tickets
- Checking their queue or their team queue for incoming tickets
- Taking customer calls and creating new tickets
- Resolving issues that can be managed by phone or by providing information, such as a knowledge base article
- For issues that require field service, schedule service and allocate resources, and
- Ensuring tickets are closed in a timely manner, following up with customers to ensure resolution.

The screenshot displays the SAP Service Ticketing interface with a list of end-of-day tasks on the left and a dashboard on the right. The tasks are:

- Check remaining and open tickets.
- Check the Weather widget for weather related issues.
- Schedule customer site visits for the next day.

The dashboard on the right shows the following ticket counts:

My Tasks	My High Priority Tickets	Unassigned Tickets
6	6	0

Below the counts, there is a search bar and a list of tickets. One ticket is highlighted: "102 - Stationary bike". Its details are:

- Escalation Status: Not Escalated
- Assigned to: Sabine Hoover
- Service Technician: [Name]

Figure 13: Performing Daily Tasks: End of Day Tasks

We're almost at the end of the Day in the Life of a Service Agent. Before they leave for the day, they can prepare for the next day by checking remaining and open tickets one more time.

They now have a weather widget that allows them to check the weather and make sure there are no alerts for tomorrow's service calls. Finally, they can finish the day by scheduling any final customer site visits for the next day.

LESSON SUMMARY

You should now be able to:

- Navigate the User Interface
- Use Personalization
- Determine the priority of service tasks
- Identify the daily tasks of the business user

Configuring SAP Service Cloud

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Perform adaptation tasks
- Create a mashup
- Perform scoping tasks to configure SAP Service Cloud

Service Cloud Adaptation

- Used to customize and extend the application to meet business requirements.
- Changes made impact all users.
- You must first enable Adaption mode before you can use it. On the User menu, select:
 1. Settings to enable
 2. Start Adaptation to use

Figure 14: SAP Service Cloud Adaptation Mode

Implementation consultants and administrators use Adaptation mode to customize and extend SAP Service Cloud. The changes made then affect the entire system. Use this feature to tailor the application to meet the specific requirements for the business.

While the types of customizations are endless, a few examples include: adding a new field to a work center; managing the ticket master layout; changing field labels; and setting a field to required, visible or hidden.

Adaptation mode must first be enabled. Do this from the User menu under Settings, Adaptation Settings. You then start adaptation by selecting "Start Adaptation" from the user menu.

Use Adaptation to Hide a Field

Simulation

For more information on this topic please view the simulation in the lesson *Configuring SAP Service Cloud* in your online course.

Use Adaptation to Hide a Field

Simulation

For more information on this topic please view the simulation in the lesson *Configuring SAP Service Cloud* in your online course.

Mashups

Definition	SAP Service Cloud customization to use data from online web services or applications
Types	URL; HTML; Data
Preconfigured examples	Embedded Map; Embedded Routes; Tweets
How to view options	Click a link on the screen; Access via web services; Use external search providers e.g Google or Bing; Display as an embedded screen

Figure 15: Mashups

A mashup is the customization of SAP Service Cloud to use data provided by an online web service or application. For example, a service agent using a weather forecast widget to check if any service routes might be affected for the next day. There are three types of mashup: URL; HTML; and data.

SAP Service Cloud includes a number of preconfigured mashups, but the implementation consultant or administrator can also create their own, as needed by business requirements. Examples of preconfigured mashups: Embedded Maps; Embedded Routes; Tweets by handle.

Once created, the results of a mashup can then be:

- A clickable hyperlink on an SAP Service Cloud screen or screens out to access a web service, or an external search provider such as Google or Bing
- Displayed on an embedded screen or frame within SAP Service Cloud

Unit 1

Exercise 8

Create a Mashup

Simulation

For more information on this topic please view the simulation in the lesson *Configuring SAP Service Cloud* in your online course.

Create a Mashup

Simulation

For more information on this topic please view the simulation in the lesson *Configuring SAP Service Cloud* in your online course.

Configuration Using Scoping and Fine Tuning

The SAP Service Cloud system is configured (customized) during implementation using Scoping which is then fine tuned using a system generated activity list from the scoping.

Scoping and fine tuning take place in the system implementation project, located in the Business Configuration work center of SAP Service Cloud .

Scoping and Fine Tuning

Select each button for more.

Animation

For more information on this topic please view the animation in the lesson *Configuring SAP Service Cloud* in your online course.

Scope the system by selecting the relevant features according to the business requirements. Think of this as selecting the business's needed items from a catalog of items.

CARE - Scoping selections are dynamic, so then affect the available choices in other areas of the SAP Service Cloud system.

Scoping starts with some basic information about the company concerned, for example the country or countries where it does business and the type of business. The system uses this to make pre-selections. Other decisions about the business are made by selecting elements and answering questions to ensure the system features the business will need are enabled and configured according to its requirements.

The business's countries and locales of practice and business type are the starting features for configuration using scoping, as just mentioned. Other important, following features include the managing of customer communication such as allowing the system to accept incoming:

1. Emails via Business to Business or Business to Customer channels

2. Phone calls.

Other system features included in configuration with scoping are integrating SAP Service Cloud with an external knowledge base, enabling warranty management and maintenance plans, and much more.

Fine Tuning follows scoping where you further tailor the solution by adjusting the predefined settings to meet more specific requirements. This is done using activities in an Activities List that is automatically generated by the system based on your scoping decisions. Some examples of settings you can fine tune are:

1. Email settings
2. Party role determination
3. Work distribution rules
4. Number ranges

Select Features with Scoping

Simulation

For more information on this topic please view the simulation in the lesson *Configuring SAP Service Cloud* in your online course.

LESSON SUMMARY

You should now be able to:

- Perform adaptation tasks
- Create a mashup
- Perform scoping tasks to configure SAP Service Cloud

Learning Assessment

1. What's the primary reason why SAP Cloud for Customer would be a perfect fit for an example business case company like Aspen Bicycles?

Choose the correct answer.

- ☐ A A growing global market
- ☐ B High quality manufacturing
- ☐ C Sales and service
- ☐ D Fast growing
- ☐ E Legacy systems

2. Which of the following ways can a customer interact with a service agent using SAP Service Cloud?

Choose the correct answers.

- ☐ A Email
- ☐ B Work Requests
- ☐ C Chat
- ☐ D SAP FSM Integration

3. Which statement about the SAP Service Cloud Customer Service process is correct?

Choose the correct answer.

- ☐ A The process has 6 steps
- ☐ B Service Agent triggered
- ☐ C Repair Agent triggered
- ☐ D Last step is Resolve issue
- ☐ E Fourth step is Respond

4. Which statement about the Field Service Management process is correct?

Choose the correct answer.

- ☐ A Time is logged in Logistics
- ☐ B Maintenance type is determined in Prepare
- ☐ C Service visits are scheduled in Wrap-up
- ☐ D Needs are identified in step 2
- ☐ E Work can be at a depot

5. Which of the following can be done in the Quick View?

Choose the correct answers.

- ☐ A Make a record a favorite
- ☐ B Delete a record
- ☐ C Flag a record
- ☐ D Create a Record

6. Which of these statements about Personalization is correct?

Choose the correct answer.

- ☐ A Available upon request
- ☐ B Can be used to hide fields
- ☐ C Affects all users on the same team
- ☐ D Can be used to create widgets
- ☐ E Is done at SAP Service Cloud set-up

7. What is David, a service agent, expected to do first to determine the priority of his tasks at any given time?

Choose the correct answer.

- ☐ A View the team queue.
- ☐ B Consult with his supervisor.
- ☐ C Check the unassigned tickets.
- ☐ D Check his Queue.
- ☐ E View tickets escalated to him.

8. A service agent's day consists of any tasks that contribute to a first-class service experience for their customers. Given this, which of these is a valid task for a service agent?

Choose the correct answers.

- ☐ A Check the team queue for new tickets
- ☐ B Create a new territory
- ☐ C Create new tickets
- ☐ D Perform service calls
- ☐ E Provide expert advice on specific products

9. Which one of the following statements about Adaptation is false?

Choose the correct answer.

- ☐ A Changes made impact all users
- ☐ B Enabled by selecting it in company settings
- ☐ C Is accessed from the User menu
- ☐ D Changes made impact all users
- ☐ E Can add a new field to a work center

10. What are the three types of mashup?

Choose the correct answer.

- ☐ A URL; HTML; and data
- ☐ B URL; embedded; and data
- ☐ C HTML; embedded; and data
- ☐ D URL; HTML; and embedded
- ☐ E Web service; display; tweet

11. Which configuration task would be completed in Fine Tuning?

Choose the correct answer.

- ☐ A Activate maintenance plans
- ☐ B Add a country
- ☐ C Integrate with external systems
- ☐ D Define a range of numbers
- ☐ E Configure warranties

UNIT 2

Manage Customer Interaction

Lesson 1

Managing Customer Interaction	52
Exercise 11: View a Service Level Agreement	55
Exercise 12: Accept an Incoming Call in the Live Activity Center	59
Exercise 13: Use the Solution Finder with a Knowledge Base	63
Exercise 14: Escalate a Service Ticket	67

Lesson 2

Configuring Customer Interaction	72
Exercise 15: Configure the System to Handle Phone Calls	75
Exercise 16: Configure Email Communication	79
Exercise 17: Configure Email Response to Customer	81
Exercise 18: Configure a Web Service for a KB	85
Exercise 19: Configure a Data Mashup for a KB	87

UNIT OBJECTIVES

- Articulate the work distribution process
- Process a service ticket via phone
- Process a service ticket using the Solution Finder with a Knowledge Base
- Escalate a service ticket
- Identify key built-in reports
- Configure SAP Service Cloud to make and receive phone calls
- Configure the system to receive emails
- Integrate a searchable knowledge base

Managing Customer Interaction

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Articulate the work distribution process
- Process a service ticket via phone
- Process a service ticket using the Solution Finder with a Knowledge Base
- Escalate a service ticket
- Identify key built-in reports

Explain Service Level Agreements and Work Distribution

The following are combined and integrated in SAP Service Cloud for a more efficient and productive customer relationship:

1. Communications channels
2. Service Level Agreements or SLAs
3. Work Distribution

Communication Channels

+ Service Level Agreements (SLAs) + Work Distribution

SAP Service Cloud allows your customers to communicate with service agents through a number of channels, some of which are built in and some which allow integration with third party tools. This includes, but isn't limited to:

- Self-Service Support
- Phone
- Social Media

- E-mail
- Chat
- SMS

Figure 18: Communication Channels

Communication Channels

SAP Service Cloud allows your customers to communicate with service agents through a number of channels, some of which are built in and some which allow integration with third party tools. This includes, but isn't limited to:

1. Self-Service Support
2. Phone
3. Social Media
4. E-mail
5. Chat
6. SMS (Short Message Service)

Communication Channels

Service Level Agreements (SLAs)

+ Work Distribution

A SLA is an agreement between a company and a customer on how long it will take to respond to and resolve a service issue. For example:

- Bronze: response within 24 hours, 2 days to resolve
- Silver: 12 hour response, 8 hour resolution
- Gold: 1 hour response, 2 hour resolution

SLAs are configured by the implementation team, so when you create a ticket, the system will automatically recognize the customer's service level and populate the response time.

Figure 19: SLAs

Service Level Agreements

A SLA is an agreement between a company and a customer on how long it will take to respond to and resolve a service issue. For example:

1. Bronze: response within 24 hours, 2 days to resolve
2. Silver: 12 hour response, 8 hour resolution
3. Gold: 1 hour response, 2 hour resolution

Note:

SLAs are configured by the implementation team, so when you create a ticket, the system will automatically recognize the customer's service level and populate the response time.

Communication
Channels

Service Level
Agreements (SLAs)

Work Distribution

A set of rules deciding how to automatically route tickets based on information on the ticket, such as the customer name, geographic region, SLA, status, or any other relevant information. For example, a global chain, with locations around the world:

- When a ticket comes in from a specific location, we'd like to route the ticket to an agent in that country.
- Let's say the ticket is also high priority. Now, the same ticket is automatically routed to the escalation team.

Work distribution rules are configured by the implementation team, so the service agent doesn't have to worry about how tickets are routed...they can focus on providing support to their customers.

Figure 20: Work Distribution

Work Distribution

Work distribution is a set of rules deciding how to automatically route tickets based on information on the ticket, such as the customer name, geographic region, SLA, status, or any other relevant information. For example, a global chain, with locations around the world:

1. When a ticket comes in from a specific location, we'd like to route the ticket to an agent in that country.
2. Let's say the ticket is also high priority. Now, the same ticket is automatically routed to the escalation team.

Note:

Work distribution rules are configured by the implementation team, so the service agent doesn't have to worry about how tickets are routed.

Manage Customer Interaction - Receive Call

Let's look at what happens when a customer reaches out to our company by phone.

SAP Service Cloud has a built in phone integration system. Commonly, phone integration is called Computer Telephony Integration, or CTI for short. Most modern digital phone systems have a CTI client that can be configured during implementation.

Once the Computer Telephony Integration (CTI) client is set up, phone calls come in via the Live Activity Center. This feature is an interface that allows you to easily view the contact information for incoming phone calls, as long as the incoming phone number matches one of your contacts. This makes the job of the service agent easy, because they don't have to search for the contact or account while they are on the phone; it automatically pops up on their screen.

A service agent can also open the Live Activity Center from the Service menu to search for a history of calls.

Accept an Incoming Call in the Live Activity Center

Accept an Incoming Call in the Live Activity Center

Simulation

For more information on this topic please view the simulation in the lesson *Managing Customer Interaction* in your online course.

Solution Finder and Knowledge Base

No matter how smart your agents are, sometimes they're not going to know the answer to a question right away. Even if they do, it's good to have a repository of documents or articles you can send to a customer if a resolution to a problem is something they can do themselves. That's where the Knowledge Base comes in.

While SAP Service Cloud doesn't have a built-in knowledge base, it does allow you to easily integrate with third party knowledge bases, including the knowledge base feature of SAP Jam.

Using a knowledge base allows your organization to provide your customers with incident-specific documents related to their specific issue. Articles can be published immediately and kept up to date, and can include rich content such as embedded screenshots. Finally, popular articles are easy to find, as your customers can give feedback on the quality or relevance of the article.

Use the Solution Finder with a Knowledge Base

Use the Solution Finder with a Knowledge Base

Use the Solution Finder with a Knowledge Base

Use the Solution Finder with a Knowledge Base

Simulation

For more information on this topic please view the simulation in the lesson *Managing Customer Interaction* in your online course.

Escalate a Service Ticket

The service agent will use SAP Service Cloud to ensure that all customer issues are addressed quickly and appropriately. This may involve escalating a ticket to engage another individual or team. For example, a fix suggested in an email by the service agent does not work. This open ticket can then be escalated by the service agent to an expert or service technician with a heightened priority such that the customer might then get a phone call directly to discuss the problem and its resolution. Alternatively, the service agent could schedule for an onsite repair, or for the item to be sent in for repair as may be appropriate to further process the open ticket.

Escalate a Service Ticket

Simulation

For more information on this topic please view the simulation in the lesson *Managing Customer Interaction* in your online course.

Escalate a Service Ticket

Simulation

For more information on this topic please view the simulation in the lesson *Managing Customer Interaction* in your online course.

Key Service Reports

Determine the key performance indicators (KPIs) for your service team by selecting from a number of reports of service tickets that are built-into SAP Service Cloud. For example:

1. All Tickets
2. Ticket Backlog
3. Tickets by Status
4. Tickets by Agent
5. Resolution times for service tickets/incidents - Open Incidents; Created vs. Solved Incidents; Incident History

Reports can then be collected into a dashboard for an at-a-glance view of service key performance indicators.

SAP Service Cloud Reports and Dashboards

Simulation

SAP Service Cloud dashboard of 4x service related reports

3rd party reporting tools

Figure 26: Integrate with SAP Analytics Cloud or 3rd Party

If you'd like to take advantage of more complex, enterprise level reporting, you can integrate SAP Service Cloud with SAP Analytics cloud or other third party reporting tools. Here is a link to learn more about SAP Analytics Cloud <https://youtu.be/8WpH600Xq0E>

LESSON SUMMARY

You should now be able to:

- Articulate the work distribution process
- Process a service ticket via phone
- Process a service ticket using the Solution Finder with a Knowledge Base
- Escalate a service ticket
- Identify key built-in reports

Configuring Customer Interaction

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Configure SAP Service Cloud to make and receive phone calls
- Configure the system to receive emails
- Integrate a searchable knowledge base

Phone Communication

SAP Service Cloud's Live Activity Center is where Agents interact with customers through real-time communication channels such as phone and live chat. The agents use Click to Call to make outbound calls directly from a contact in the Live Activity Center.

For Live Activity Center to be used to receive and make phone calls, SAP Service Cloud requires a Computer Telephony Integration (CTI) desktop client to connect to the organization's phone system. Sinch Contact Center, formerly SAP Contact Center, can be this CTI desktop client, or any equivalent third party CTI provider.

As SAP Service Cloud does not have a native CTI, a CTI client adapter is also needed and is included with it. The adapter is used to integrate with the Live Activity Center the many CTI functions including accepting, rejecting, ending, and transferring calls. The CTI client adapter must be installed on every device that will be using Live Activity Center.

CTI Phone Communication Process

The CTI Desktop Client sends the phone event, such as a call, to the Live Activity Center through the CTI Client adapter. The Live Activity Center looks up the customer or ticket using the data received and allows the creation of a new customer or ticket. In addition to voice, attached data can be captured through interactive voice response, or IVR, and associated with the call as well.

If we assume that the CTI client is already set up with the organization's phone system, then the steps to configure CTI are as follows:

1. Enable CTI for the SAP Service Cloud system
2. Give service agents visibility to the Live Activity Center
3. Add the SAP CTI Adaptor

Configure the System to Handle Phone Calls

Simulation

For more information on this topic please view the simulation in the lesson *Configuring Customer Interaction* in your online course.

Configure the System to Handle Phone Calls

Simulation

For more information on this topic please view the simulation in the lesson *Configuring Customer Interaction* in your online course.

Email Communication

SAP Service Cloud can receive emails and automatically create tickets based on the sender.

To configure the system for email and to create tickets from email, you need to enable the communication channel for email, then create the addresses you want to receive the email.

Enabling the communication channel for email involves accessing the SAP Service Cloud implementation project to select the scoping option **Service Request Management**, then selecting these **business configuration questions**:

1. Service requests can be created for incoming emails
2. Email channels are supported for both individual (B2C) and corporate (B2B) accounts

Once the communication channel is configured, the next step is to define the list of addresses to receive the customer emails. This is done in the Administrator Work Center under Services and Social.

To configure which email address is used when responding to a customer, enter the appropriate email address in the Addresses section for each organizational (org) unit that has been defined as having a customer service function. Each org unit represents a service team or queue.

Configure Email Communication

Integrate a Knowledge Base

A knowledge base is a centralized repository of information that service agents can leverage as they need in processing the tickets they receive from customers. For example, agents can readily provide customers relevant documents or articles relating to the subject of their tickets. While SAP Service Cloud doesn't have a built-in knowledge base, it does allow you to easily integrate with third party knowledge bases, as well as with the knowledge base feature of SAP Jam.

An example third party knowledge base provider is MindTouch. MindTouch (and other providers) has OpenSearch standards, so the integration of this knowledge base with SAP Service Cloud is easily configured as a mashup. The agent would access the knowledge base from Service Cloud via the Solution Finder tab on the ticket.

Configuring the mashup to integrate SAP Service Cloud with a third party knowledge base with OpenSearch standards comprises three steps.

The first step is to enable knowledge base integration in scoping. To do this, make sure these questions under Service > Customer Care are selected as in scope:

1. The Knowledge Base question "You can capture and share your knowledge in a central repository."
2. The Service Request Management question "Do you want to enable the knowledge base integration feature of the agent workspace?"

The next step is to configure a web service for SAP Service Cloud to access content from the knowledge base. To do this you need to provide SAP Service Cloud the URL for the knowledge base and any other parameters such as user name and logon password that the knowledge base vendor specifies.

The last step is to then configure a data mashup. You do this by specifying the mapping between, on the one hand, the search parameters used by the SAP Service Cloud system and, on the other, the web service input parameters of the knowledge base.

Configure a Web Service for a KB

LESSON SUMMARY

You should now be able to:

- Configure SAP Service Cloud to make and receive phone calls
- Configure the system to receive emails
- Integrate a searchable knowledge base

Learning Assessment

1. What is the work distribution process?

Choose the correct answer.

- ☐ A Involves automatically taking inbound phone calls.
- ☐ B Call routing to evenly distribute the workload.
- ☐ C The provision of a range of communication channels for customers.
- ☐ D Call distribution by customers' service level agreements.
- ☐ E Configurable work distribution rules for ticket routing.
- ☐ F Combined service level agreements and communication methods.

2. In what application does the service agent see the contact information for incoming calls?

Choose the correct answer.

- ☐ A Service Agent Desktop
- ☐ B Live Activity Center
- ☐ C Call Center
- ☐ D Live Chat
- ☐ E Broadcast Message

3. Which of the following is true regarding using a knowledge base with SAP Service Cloud?

Choose the correct answers.

- ☐ A SAP Service Cloud includes a knowledge base
- ☐ B SAP Service Cloud allows integration with third party knowledge bases
- ☐ C Contacts can create their own knowledge base articles
- ☐ D Service Agents can share knowledge base articles with contacts
- ☐ E The SAP Service Cloud knowledge base is called Solution Finder

4. On which menu will you find the option to Escalate a service ticket?

Choose the correct answer.

- ☐ A View
- ☐ B Service
- ☐ C Actions
- ☐ D Activities
- ☐ E Work Center

5. Which report could you use for the key performance indicator of ticket resolution time?

Choose the correct answer.

- ☐ A Incident History
- ☐ B Dashboard
- ☐ C KPI History
- ☐ D Tickets by Status
- ☐ E Ticket Backlog

6. What SAP application can you use as a local adapter for telephony integration?

Choose the correct answer.

- ☐ A Click to Call
- ☐ B Live Activity Center
- ☐ C Data Mash
- ☐ D CTI Client Adapter
- ☐ E Sinch Contact Center

7. Which of the following statements about configuring SAP Service Cloud to receive emails is true?

Choose the correct answer.

- ☐ A The step to enable the communication channel for email is last.
- ☐ B The addresses to receive customer emails are defined in scoping.
- ☐ C The customer service function's email address is in its org unit.
- ☐ D The business configuration questions are in the Administration work center.
- ☐ E Scoping is done in the Administration work center under Services and Social.

8. What type of mashup would you use to integrate a knowledge base?

Choose the correct answer.

- ☐ A Data
- ☐ B URL
- ☐ C RSS/Atom
- ☐ D HTML
- ☐ E REST

UNIT 3

Configure Ticket Routing

Lesson 1

Automatically Assigning Tickets to Service Teams	96
Exercise 20: Create a Work Distribution Rule	97

Lesson 2

Using Service Level Agreements	100
Exercise 21: Use a Service Level Agreement	101

UNIT OBJECTIVES

- Use work distribution rules to automatically assign tickets to service teams
- Use service level agreements (SLAs)

Automatically Assigning Tickets to Service Teams

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Use work distribution rules to automatically assign tickets to service teams

Automatically Assign Tickets

Routing or work distribution rules help companies handle a high volume of tickets. While smaller organizations can assign a service agent to review each message to then create and assign tickets to the right person or team, this isn't an efficient model when hundreds, or even thousands, of messages come in each day. As a result, a routing mechanism that automatically delivers the ticket to the right team or person can significantly increase efficiency. SAP Service Cloud includes a flexible, easy to configure routing rule definition engine.

The first step is to create the teams in the system within an Organizational Structure. Ticket routing rules can then be configured for the teams in the structure. Examples of routing rules for a service organization:

1. Any ticket from a particular customer routed to a specific team
2. Any ticket of a certain type or category to a specific team
3. Any ticket with the status Escalated to a specific team

Create a Work Distribution Rule

Simulation

For more information on this topic please view the simulation in the lesson *Automatically Assigning Tickets to Service Teams* in your online course.

Create a Work Distribution Rule

Simulation

For more information on this topic please view the simulation in the lesson *Automatically Assigning Tickets to Service Teams* in your online course.

LESSON SUMMARY

You should now be able to:

- Use work distribution rules to automatically assign tickets to service teams

Using Service Level Agreements

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Use service level agreements (SLAs)

Create and Manage Service Level Agreements

			
	"A" Accounts	"B" Accounts	"C" Accounts
SLA	Platinum	Gold	Silver
Coverage	24/7/365	Working Hours 7 days a week	Working hours Monday-Friday
Response	30 minutes	2 hours	4 hours
Resolution	4 hours	8 hours	24 hours

Figure 34: Create and Manage Service Level Agreements

A Service Level Agreement, or SLA, is an agreement between a service provider and a customer that determines the initial response and completion due time and date for the resolution of issues.

SAP Service Cloud has this functionality for the key dates in tickets it receives to be determined by an SLA - what the initial response and completion due time and date for a given ticket's resolution should be. You can have varying SLAs with varying key dates.

What happens then, is that SLAs can be created in the system that the system can then assign to tickets as they are received. For example, Platinum, Gold and Silver. A ticket with a given SLA when it is received will then automatically start counting down against the set key dates. As a result, tickets receive an initial response by a certain time or date, and should be solved by another time and date.

You can define rules to determine which SLA should be applied to each ticket. That means that for example, a ticket coming from Germany can be treated with an SLA based on the German holiday calendar, while tickets coming from the US, will be treated with an SLA based on the US holiday calendar. Finally, the ticket can be routed to the appropriate team based on work distribution rules.

Use a Service Level Agreement

Simulation

For more information on this topic please view the simulation in the lesson *Using Service Level Agreements* in your online course.

Use a Service Level Agreement

Simulation

For more information on this topic please view the simulation in the lesson *Using Service Level Agreements* in your online course.

LESSON SUMMARY

You should now be able to:

- Use service level agreements (SLAs)

Learning Assessment

1. Which feature makes sure tickets are assigned to the right team based on your business requirements?

Choose the correct answer.

- ☐ A Service Level Agreements
- ☐ B Work Distribution Rules
- ☐ C Maintenance Plans
- ☐ D Contract Rules
- ☐ E Ticket Management Rules

2. In which type of object would you configure the initial response and completion time for a ticket, based on an agreement between the service provider and the customer?

Choose the correct answer.

- ☐ A Work Distribution Rule
- ☐ B Service Category
- ☐ C Service Level
- ☐ D Maintenance Plan
- ☐ E Account Type

UNIT OBJECTIVES

- Name the Steps in the Field Service Process
- Assign a work ticket to a Service Technician
- Complete a service call
- Configure the system to allow time recording

Unit 4

Lesson 1

Performing a Service Call

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Name the Steps in the Field Service Process
- Assign a work ticket to a Service Technician
- Complete a service call

Field Service Process Overview

The field service technician's day involves service calls, often at the customer location, to resolve issues that can't be resolved via remote channels. This person's process:

1. Determine if a service is needed. This may be in response to a single contact with the customer from an email or phone call, for example, or as the result of a troubleshooting workflow.
2. If the issue can't be resolved through research and initial dialogue, the ticket is assigned to a technician and scheduled for completion.
3. The service technician executes the service either onsite or remotely.
4. The technician confirms the actual scope of the service, including: the time required; parts; and tools needed as appropriate.
5. Based on the confirmation, an invoice is generated for the customer for the service performed. This part of the process is generally done with an ERP system such as SAP S/4HANA.

The Field Service Process

Animation: Field Service Process

For more information on *Field Service Process*, please view the animation in the lesson *Performing a Service Call* in your online course.

Overall steps of the field service process:

1. Determine if a service is needed. This may be in response to a single contact with the customer from an email or phone call, for example, or as the result of a troubleshooting workflow.
2. If the issue can't be resolved through research and initial dialogue, the ticket is assigned to a technician and scheduled for completion.
3. The service technician executes the service either onsite or remotely.
4. The technician confirms the actual scope of the service, including: the time required; parts; and tools needed as appropriate.
5. Based on the confirmation, an invoice is generated for the customer for the service performed. This part of the process is generally done with an ERP system such as SAP S/4HANA.

Assign a Work Ticket to a Field Service Technician

1. Check "Requires Work" when creating the ticket

2. Assign a Service Technician to the ticket

3. Release for Scheduling to indicate it's ready for planning

Release For Scheduling

Check Consistency

Figure 36: Create and Assign a Work Ticket

When a service is needed, a work ticket is created. A Work Ticket is a type of ticket that includes work to be performed by a service technician. To make a ticket a Service Ticket, check the "Requires Work" box when creating the ticket. You then assign a service technician to the ticket and release the ticket for scheduling to indicate that it is ready for planning.

In planning

1. The ticket status is cumulated on the header.
2. The job is calculated based on the planning of the ticket quantity in the service item.

If manually assigning a service technician is not efficient, for example there are many agents, skill sets and schedules involved, then there are these options depending on the scale of your activities:

1. SAP Service Cloud's built-in Resource Scheduler for basic resource scheduling, but this is only available for existing clients, not for new installations.

(Hyperlink for "Learn More about Resource Scheduler: https://microlearning.opensap.com/media/1_ymu2mcga)

1. Integration with SAP Multiresource Scheduling, or MRS. SAP MRS replicates work tickets as demands that reference ticket details. Resource Assignments are then created in SAP MRS and are replicated into the SAP Service Cloud work ticket to update the service technician, requested start date, and requested end date fields. (For more information please refer to Solution Guide <https://help.sap.com/doc/22643a8dc4a44976ba9c7eca63f4ddf9/CLOUD/en-US/SolutionGuideService.pdf>)
2. For full featured planning and dispatching, SAP Service Cloud can be integrated with SAP Field Service Management, or FSM. Resource Assignments are created in SAP FSM and are replicated into the work ticket in SAP Service Cloud.(Hyperlink for "Learn More about FSM: <https://bit.ly/3udsyLZ>)

Create and Assign a Work Ticket

Animation: Create and Assign a Work Ticket

Assign a Work Ticket

Assign a Work Ticket

Simulation

For more information on this topic please view the simulation in the lesson *Performing a Service Call* in your online course.

Complete a Service Call

The field service technician checks the details of the work ticket assigned to him/her and undertakes the service call. When the job is complete the technician updates the work ticket accordingly and logs the time spent so the customer can be invoiced, or the time can be charged against a warranty or maintenance plan.

Time entries can be recorded in a ticket, or independently of a ticket.

One way a technician can record time is to start a recording when they start a task, and stop recording when they are done. Another is to record the amount of time spent on a task once they are complete.

LESSON SUMMARY

You should now be able to:

- Name the Steps in the Field Service Process
- Assign a work ticket to a Service Technician
- Complete a service call

Configuring the System to Allow Time Recording

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Configure the system to allow time recording

Configure Time Recording

Time recording must be configured for service technicians to record their time. A number of steps are involved.

First, Time recording must be activated in scoping. To do this, go to the questions section and open General Business Data; Employees and Service Agents; and Employees. Under the Time Recording section, ensure the question "Do you wish to enable Time Recording feature?" is in scope. Then, so that the recorded time is approved automatically, which releases it for invoicing, you can also check 'in scope' for the question "Do you want the system to automatically submit a time report for approval?".

The next step is to ensure that service agents have access to the time recording work center. This is done in the Administrator work center under General Settings; Business Roles.

Finally, to ensure that time entries are replicated as a cost object from SAP Service Cloud to the invoicing system, time entry must be added to the Service Cloud product catalog.

Configure Access to Time Recording

Simulation

For more information on this topic please view the simulation in the lesson *Configuring the System to Allow Time Recording* in your online course.

Configure a Service Product for Time Recording

Simulation

For more information on this topic please view the simulation in the lesson *Configuring the System to Allow Time Recording* in your online course.

LESSON SUMMARY

You should now be able to:

- Configure the system to allow time recording

Learning Assessment

1. Which of the following is a step in the field service process?

Choose the correct answers.

- ☐ A The service team determines if service is needed
- ☐ B The service call is assigned to a service agent
- ☐ C The service technician assigns the work ticket to the service agent
- ☐ D The service technician records the time spent on the service call
- ☐ E The service agent creates the invoice as advised by the service technician

2. What is the last step the service agent performs when assigning a work ticket to a service technician?

Choose the correct answer.

- ☐ A Activate the ticket
- ☐ B Release for Scheduling
- ☐ C Check Consistency
- ☐ D Set Status to Open
- ☐ E Check Requires Work

3. Which of the following tasks is generally performed by the service technician?

Choose the correct answer.

- ☐ A Log time after a service call
- ☐ B Assign the ticket to the customer
- ☐ C Request a start date for the service call
- ☐ D Assign a priority to the work ticket
- ☐ E Invoice their time

4. Time recording needs to be configured in SAP Service Cloud for technicians to then be able to record their time. Why does this configuration involve the creation of a service product in the Service Cloud product catalog?

Choose the correct answer.

- ☐ A To activate time recording
- ☐ B To give technicians access
- ☐ C For invoicing the customer
- ☐ D For manager approval
- ☐ E For automatic approval

UNIT 5

Manage Objects to Support the Service Process

Lesson 1

Using Installed Bases and Registered Products	128
Exercise 26: Create a Registered Product	131
Exercise 27: Create an Installed Base	135
Exercise 28: Add Registered Products to an Installed Base	139

Lesson 2

Using Maintenance Plans	142
Exercise 29: Create a Maintenance Plan	145
Exercise 30: Schedule a Maintenance Plan	147
Exercise 31: Create a Recall Campaign	151

Lesson 3

Managing Warranties	154
Exercise 32: Configure the System to Allow Warranties	157
Exercise 33: Grant Access to the Warranties Work Center	159
Exercise 34: Create a Warranty and Assign to a Registered Product	163

UNIT OBJECTIVES

- Distinguish the terms registered product, installed base and installation point
- Create a registered product
- Create an installed base
- Add registered products to an installed base
- Distinguish the types of maintenance plan
- Use a maintenance plan for preventative maintenance
- Use a Maintenance Plan to create a Recall Campaign
- Explain warranty management
- Configure the system to allow warranties
- Create a warranty and assign it to a registered product

Using Installed Bases and Registered Products

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Distinguish the terms registered product, installed base and installation point
- Create a registered product
- Create an installed base
- Add registered products to an installed base

Registered Product, Installed Base, Installation Point

Figure 39: A Registered Product

In SAP Service Cloud, a registered product is an instance of a product that is associated with a specific customer. A customer registering a product they purchased then enables the service desk agent to identify the unique customer product and determine service entitlements if a problem occurs. If a warranty exists for the product, the system links to the relevant warranty and automatically determines the relevant warranty dates. This significantly streamlines the customer service process. The same applies should the customer have multiple registered products at a single site and/or across multiple sites. For example a single exercise bike owner and then a hotel business with, say, one hotel in each of 2 cities, with several exercise bikes in their gyms.

Products can be physical, for example exercise bikes, services, like an electrician, or entitlements, like a software license. Products can also be combined for a customer. For example an exercise bike combined with a service contract for it.

A single customer's combined products are referred to as an installed base in SAP Service Cloud. An Installed Base is a hierarchical arrangement of the sites where the products are located and the registered products themselves. For example, a rental car agency with twenty cars that is operating in two cities, with two rental locations in each, or a company with cloud-based software licenses, one dedicated web address with ten logins.

SAP Service Cloud also provides, for each product in the installed base hierarchy, an installation point where information about the product's specific location can be maintained. That earlier hotel business's exercise bikes could then be an installed base hierarchy comprising 2 sites (cities), each with a hotel, but the one, larger hotel, then sub-divided as it has two gyms not one.

An installed base allows, particularly the larger, customer to have its assets better tracked and managed, again, significantly streamlining the customer service process. A customer's installed assets can: be tracked; each have an employee responsible and a primary technician assigned; have their service histories tracked.

Create a Registered Product

Add Registered Products to an Installed Base

Simulation

For more information on this topic please view the simulation in the lesson *Using Installed Bases and Registered Products* in your online course.

LESSON SUMMARY

You should now be able to:

- Distinguish the terms registered product, installed base and installation point
- Create a registered product
- Create an installed base
- Add registered products to an installed base

Using Maintenance Plans

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Distinguish the types of maintenance plan
- Use a maintenance plan for preventative maintenance
- Use a Maintenance Plan to create a Recall Campaign

Overview of Maintenance Plans

A maintenance plan is:

1. A plan of preventive maintenance automatically creating work tickets based on a prearranged schedule
2. A combination of a:
 - a) Condition (when a ticket should be scheduled)
 - Counter Based
 - Time Based
 - Time and Counter Based
 - b) Schedule Type
 - Cyclical
 - Fixed
 - One Time
 - Absolute
 - One Time – No Condition

Maintenance plans help the service organization execute on preventative maintenance scenarios that may be stipulated in the Service Contract between a company and their customer. They do this by automatically creating work tickets based on the maintenance schedule.

A Maintenance Plan consists of a Condition and a Schedule Type. Both of these fields are required to define a maintenance plan. The Condition defines when a ticket should be scheduled, for example: on a time interval (time based); when a counter reaches a certain value (counter based); or when a machine has run for a certain amount of time or is reading a certain value (time and counter based). The Schedule Type can be cyclical, fixed, one time, one time-no condition, or absolute (a specific measure or reading).

Condition (when a ticket should be scheduled)	Schedule Type	Example
1. Counter Based	Cyclical	Perform service every 8,000 km
2. Time Based	Fixed	First service at 12 months, second at 36 months, third at 60 months
3. Time and Counter Based	Cyclical	Perform service every 12 months or every 8,000 km
4. Counter Based	Absolute	A sensor reads > 50 degrees Celsius for three days = too hot needs service.
5. One Time – No Condition		Product recall

Figure 42: Maintenance Plan - Types

The type of maintenance plan that you can have depends on the particular combination of schedule type and condition that you decide. Here are examples of the types of maintenance plan based on the combination of schedule type and condition:

1. A condition of Counter Based with a schedule type of Cyclical could be used if you wish to perform vehicle maintenance every 8,000 km for a.
2. A condition of Time Based and a schedule type of Fixed could be used if you wish to perform service at fixed but irregular intervals, such as first service at 12 months, second service at 24 months, and third service at 60 months.
3. A condition of Time and Counter Based and a schedule type of Cyclical could be used to perform service every 12 months or every 8,000 km, whichever comes first.
4. The Absolute schedule type is based, not on usage or time, but on a reading - Counter Base. For example, if a motor sensor on a machine reads a temperature of over 50 degrees Celsius for three days meaning it's running too hot and should be serviced.
5. Finally, a schedule type of One Time - No Condition is a special type of maintenance plan that can be used for one-time special services such as a product recall.

Create and Schedule a Maintenance Plan

A maintenance plan is used by first creating it, then scheduling it:

SAP Service Cloud System		
	Work Center 	View
1. Create	Business Configuration	Implementation Projects
	Installed Base	Maintenance Plans
2. Schedule	Administrator	Service and Social
		Task
		a) Activate maintenance plans in scoping
		b) Create the maintenance plan: i. Set schedule and condition ii. Create template to generate the tickets for the maintenance iii. Add the registered products for servicing iv. Activate the plan
		Create a mass data run object (MDRO) template; associate it with the previously created maintenance plan

Figure 43: Create and Schedule a Maintenance Plan

To use a maintenance plan in SAP Service Cloud, you must first create it, then schedule it.

Creating a maintenance plan for a customer in your SAP Service Cloud system involves:

1. Activating maintenance plans in scoping
2. Setting a schedule and condition for the plan
3. Including a template for generating the service tickets the technicians will need to carry out the maintenance according to the plan
4. Assigning the specific customer items for maintenance
5. Activating the plan

Once you've created your Maintenance Plan, you'll set up a schedule on which the work tickets are generated. This is done using a Mass Data Run Object, also called a MDRO. This feature allows the scheduling and automation of complex business processes in SAP Cloud for Customer. You create the MDRO, then associate it with the maintenance plan.

Create a Maintenance Plan

Plan Definition | **Ticket Template** | Maintenance Items | Maintenance Items Log | Related Tickets

*Ticket Type: 1 | Ticket Priority: 2 | Ticket Timeline Details: 3

Set Requested Start Date: - Day(s) From Ticket Creation Date

Set Requested End Date: - Day(s) From Requested Start Date

Figure 44: Create a Recall Campaign from a Maintenance Plan

A recall campaign is the process of fixing, or retrieving, a defective and/or potentially unsafe product.

The steps to create a maintenance plan to use for a recall campaign are illustrated here and are covered in the following demonstration and exercise.

Note:

To allow a service agent to create a recall campaign, they must have access to the Maintenance Plans work center, which is not activated by default. This can be done by an administrator.

LESSON SUMMARY

You should now be able to:

- Distinguish the types of maintenance plan
- Use a maintenance plan for preventative maintenance
- Use a Maintenance Plan to create a Recall Campaign

Managing Warranties

LESSON OBJECTIVES

After completing this lesson, you will be able to:

- Explain warranty management
- Configure the system to allow warranties
- Create a warranty and assign it to a registered product

Warranty Management

No doubt you have purchased many products in your life that come with, or give you an option to purchase, a warranty. You know then, that a warranty is a type of assurance provided by a manufacturer for a customer.

The warranty generally includes any information about what is covered and what actions will be taken in the event something goes wrong with the product. In some cases, the entire product may be replaced, while in others only the replacement parts are provided. Sometimes labor services are included, while in other cases are not.

In most cases, warranties are time based, so the time frame will be an important part of the warranty.

In SAP Service Cloud, a warranty is associated with a Registered Product.

When an agent creates a ticket and adds the registered product, the warranty is automatically determined. This way the agent can clearly see whether service will be an additional cost to the customer or if it is included in the warranty. It's more accurate, and a lot faster!

Configuring Warranties

Configuration steps to use warranties:

SAP Service Cloud System			Task
Work Center	 View		
1. Activate and fine tune	Business Configuration	Implementation Projects	a) Activate warranty management in scoping b) In activity list: i. Add warranty number ranges ii. Create warranty date profile
	Administrator	General Settings	Grant access to the Warranties work center for applicable business user roles

Figure 46: Configuring Warranties

In order to use warranties in SAP Service Cloud, there are several configuration steps.

First, you'll activate Warranty Management in Scoping.

Next, in the Activity List, you'll fine tune the warranty process by adding a number range for both internal and external warranties.

The next step is to create a date profile to specify how many days after product delivery will pass before warranties take effect. This is also done in the activity list.

Finally, you'll grant access to the Warranties work center to any business users or roles that will be working with warranties.

Configure the System to Allow Warranties

Simulation

For more information on this topic please view the simulation in the lesson *Managing Warranties* in your online course.

Create a Warranty and Assign to a Registered Product

SAP Service Cloud System		
Work Center 		View
Create a warranty	Products	Warranties
Assign warranty to a product	Products 	Registered Products
		
		Task
		1. Select to create a warranty and provide: a) Name b) ID c) Duration 2. Activate the warranty
		1. Edit the product and select the previously created warranty. 2. Test by creating a ticket for the product to see the warranty field in the ticket automatically populate with the warranty details.

As long as the user has access permission, a warranty is created in the Products work center, on the Warranties view.

The required data on the warranty is the name, ID, and Duration. You can also select a coverage option if needed.

Activate Warranty Management.

You then assign a product a warranty by editing the registered product to link it to the warranty.

Create a Warranty and Assign to a Registered Product

Simulation

LESSON SUMMARY

You should now be able to:

- Explain warranty management
- Configure the system to allow warranties
- Create a warranty and assign it to a registered product

Learning Assessment

1. Which type of object contains common information, such as a physical or virtual address, for a set of registered products?

Choose the correct answer.

- ☐ A Installation Point
- ☐ B Installed Base
- ☐ C Installation Site
- ☐ D Maintenance Plan
- ☐ E Registered Site

2. Which of the following statements about creating a registered product is true?

Choose the correct answer.

- ☐ A This ability does not need to be in project scope.
- ☐ B Undertaken in the Registered Products work center.
- ☐ C Undertaken in the Installed Base work center.
- ☐ D Undertaken in the Installed Base view.
- ☐ E Can be done without reference to a customer.

3. What must be done before you can create an Installed Base?

Choose the correct answer.

- ☐ A Create at least one registered product
- ☐ B Create an account
- ☐ C Grant access to the Registered Products work center
- ☐ D Enable Installed Bases in Scoping
- ☐ E Set a location

4. Which of the following is correct regarding registered products?

Choose the correct answers.

- ☐ A Registered products do not need to be activated.
- ☐ B Registered products can be organized in a hierarchy.
- ☐ C A registered product must be assigned to an installed base.
- ☐ D A registered product can be created directly in the installed base.
- ☐ E A registered product needs an installation point.

5. Which Condition and Schedule Type should be used to create a maintenance plan that generates a work ticket for the 1st day of every month?

Choose the correct answer.

- ☐ A One time, no condition
- ☐ B Time Based, Fixed
- ☐ C Time Based, Cyclical
- ☐ D Counter Based, Cyclical
- ☐ E Time and counter based, Fixed

6. Which of the following statements about maintenance plans is correct?

Choose the correct answer.

- ☐ A Must consist of either a condition or a schedule type
- ☐ B Must consist of both a condition and a schedule type
- ☐ C Must consist of a schedule type with an optional condition
- ☐ D Ensures prompt service in case of an emergency
- ☐ E Prearranged schedule with work tickets created by the service desk

7. What must you do to schedule a maintenance plan?

Choose the correct answer.

- ☐ A Create and assign a mass data run object
- ☐ B Use the Schedule tab on the maintenance plan
- ☐ C Enable scheduling in scoping
- ☐ D Set schedule type to time and/or counter based
- ☐ E Turn off manual service tickets

8. What do you set for the Schedule Type in a Maintenance Plan for a recall campaign?

Choose the correct answer.

- ☐ A Absolute - One Time
- ☐ B One Time - Recall
- ☐ C One Time
- ☐ D One Time – No Conditions
- ☐ E Alternate

9. Which two steps you must do to ensure that a warranty is populated in a ticket?

Choose the correct answers.

- ☐ A Activate the Warranty
- ☐ B Assign the Warranty to a Registered Product
- ☐ C Assign the Warranty to an Installed Base
- ☐ D Assign the Warranty to a Maintenance Plan

10. Which task must be completed to allow the use of warranties?

Choose the correct answer.

- ☐ A Assign the warranty to an installed base
- ☐ B Add a numeric range in Administrator - Service and Social
- ☐ C Create a list of warranty coverage options
- ☐ D Add warranty information in the date profile
- ☐ E Activate Warranty Management in Scoping

11. Which is a required field when creating a warranty?

Choose the correct answer.

- ☐ A Duration
- ☐ B Coverage
- ☐ C Registered product
- ☐ D Account
- ☐ E Customer
