

## 8. Pending Decisions

### Cut Over to Interval Billing

Challenge: minimize the number of meter exchanges needed to switch configurations

Triggers:

- Existing customers in TOU rates (RS\_1010) & Plug-In Vehicles (REV\_1020 & REV\_1030) will need register based TOU meters that Meter Readers can use in order to complete validation prior to CARS (Cutover-to-Automated-Reads)

Options:

1. Deploy ESM with registers programmed to capture consumption for the time of day needed
  - Pros: Meter Reader can read meter for cutover validation
  - Cons: Additional configuration for the REV\_1020 and REV\_1030 rates will need to be held in inventory and managed. The current configuration supports the RT\_1010
2. Deploy ESM programmed for interval. Let IEE “bucket” the consumption
  - Approach:
    - Deploy register based TOU for 25 customers
    - Manually validate 25 customers
    - If successful, deploy the remaining meters configured for intervals
  - Pros: Universal meter configuration will work. Reduced inventory
  - Cons: Pre-cutover validation will have to be done manually
  - Status:
    - Customer Billing has agreed to do manual validation for 25 (of about 775).
    - Waiting for Controls to validate the number of customers appropriate for manual validation
    - Will reach out SE Deployment to comment
