SAP Service Cloud Version 2 Webinar

Onboarding, Set Up and Fundamentals

1. Overview
2. Onboarding
3. Fundamentals
4. User and Business Roles
5. Master Data
6. Service Objects

1) Overview

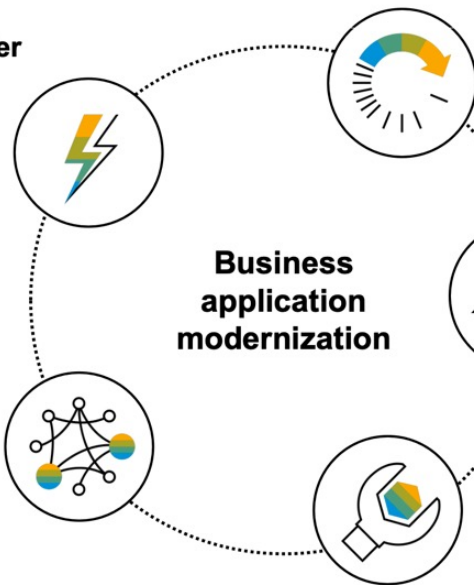

Modernization Approach

Host on hyperscaler

Flexible options for high-performance hosting environments

Microservices API first

Offering state-of-the-art composability of applications and flows enabling customer engagement everywhere

Business application modernization

Advanced business capabilities

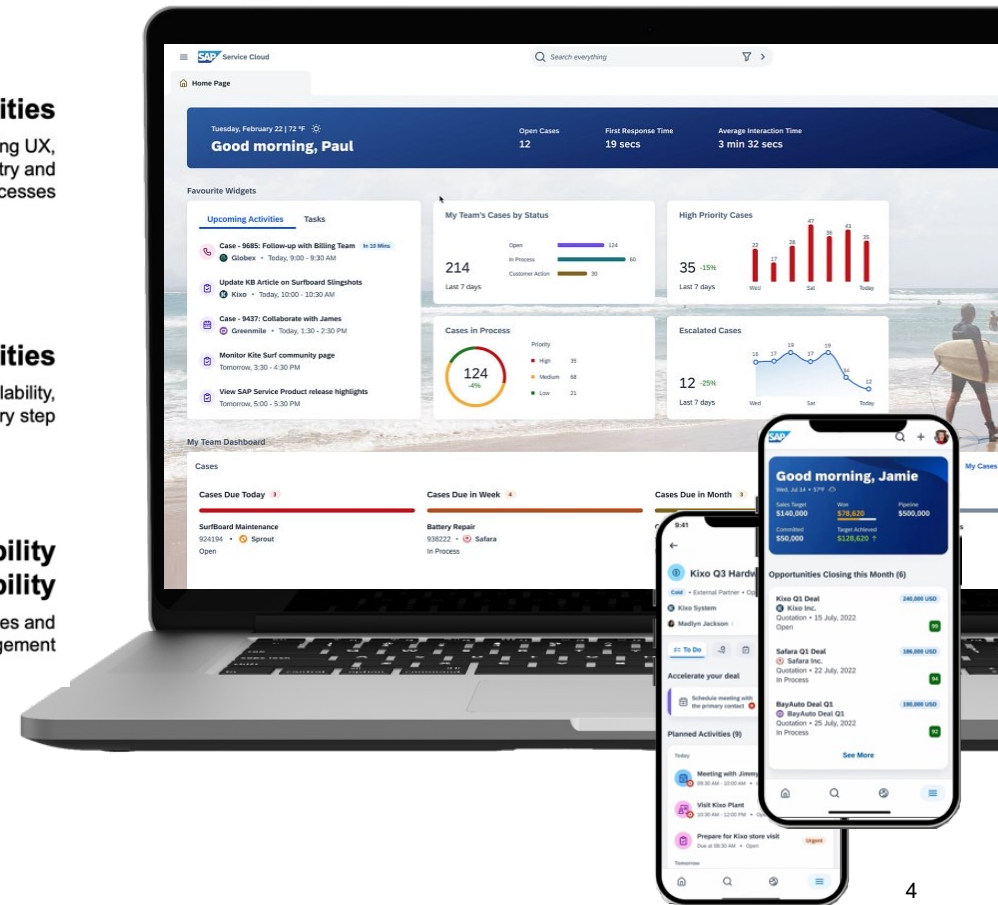

Driving resolution and effectiveness optimizing UX, embedding intelligence, and cross-industry and complete E2E processes

Improve cloud qualities

Helping ensure security, scalability, reliability, and performance at every step

Simplified extensibility and improving usability

Enabling innovative user experiences and adaptability to boost productivity and engagement

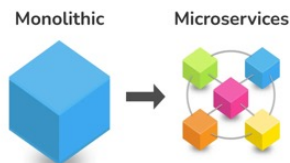

Competitive edge through unique differentiators

Modern Platform

Superior performance & modern architecture

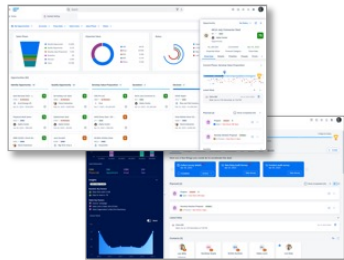

- State-of-the-art cloud-native technology stack with superior app performance
- Open technology stack ensures future integration and extensibility from and to SAP and ecosystem partners
- Best-in-class total cost of ownership thanks to modern architecture

User Experience

Excellent user experience

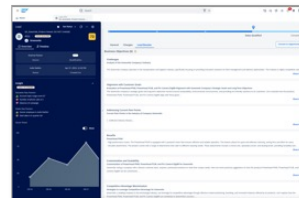

- More modern and advanced UX than competitors
- Guided approach boosts UX for representatives
- Embedded intelligence and productivity tools power specific workspaces

Business AI

Front-runner in GenAI with Joule & CX AI Toolkit

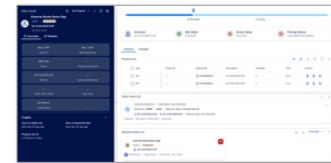

- Summarized external insights to enable faster lead nurturing with lead boosters
- Account Synopsis delivering summarized external data about customer's business
- Contextual smart actions
- Intelligent Q&As

SAP S/4HANA Integration

Enabling lower TCO and seamless E2E processes

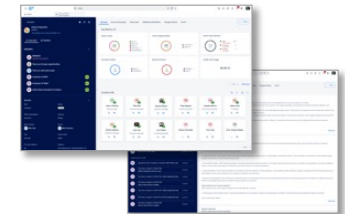

- Standard lead-to-cash integration with SAP S/4HANA
- Integrated master data and sales processes
- No cost for integration technology
- No cost for integration setup
- No cost for integration maintenance

Customer 360

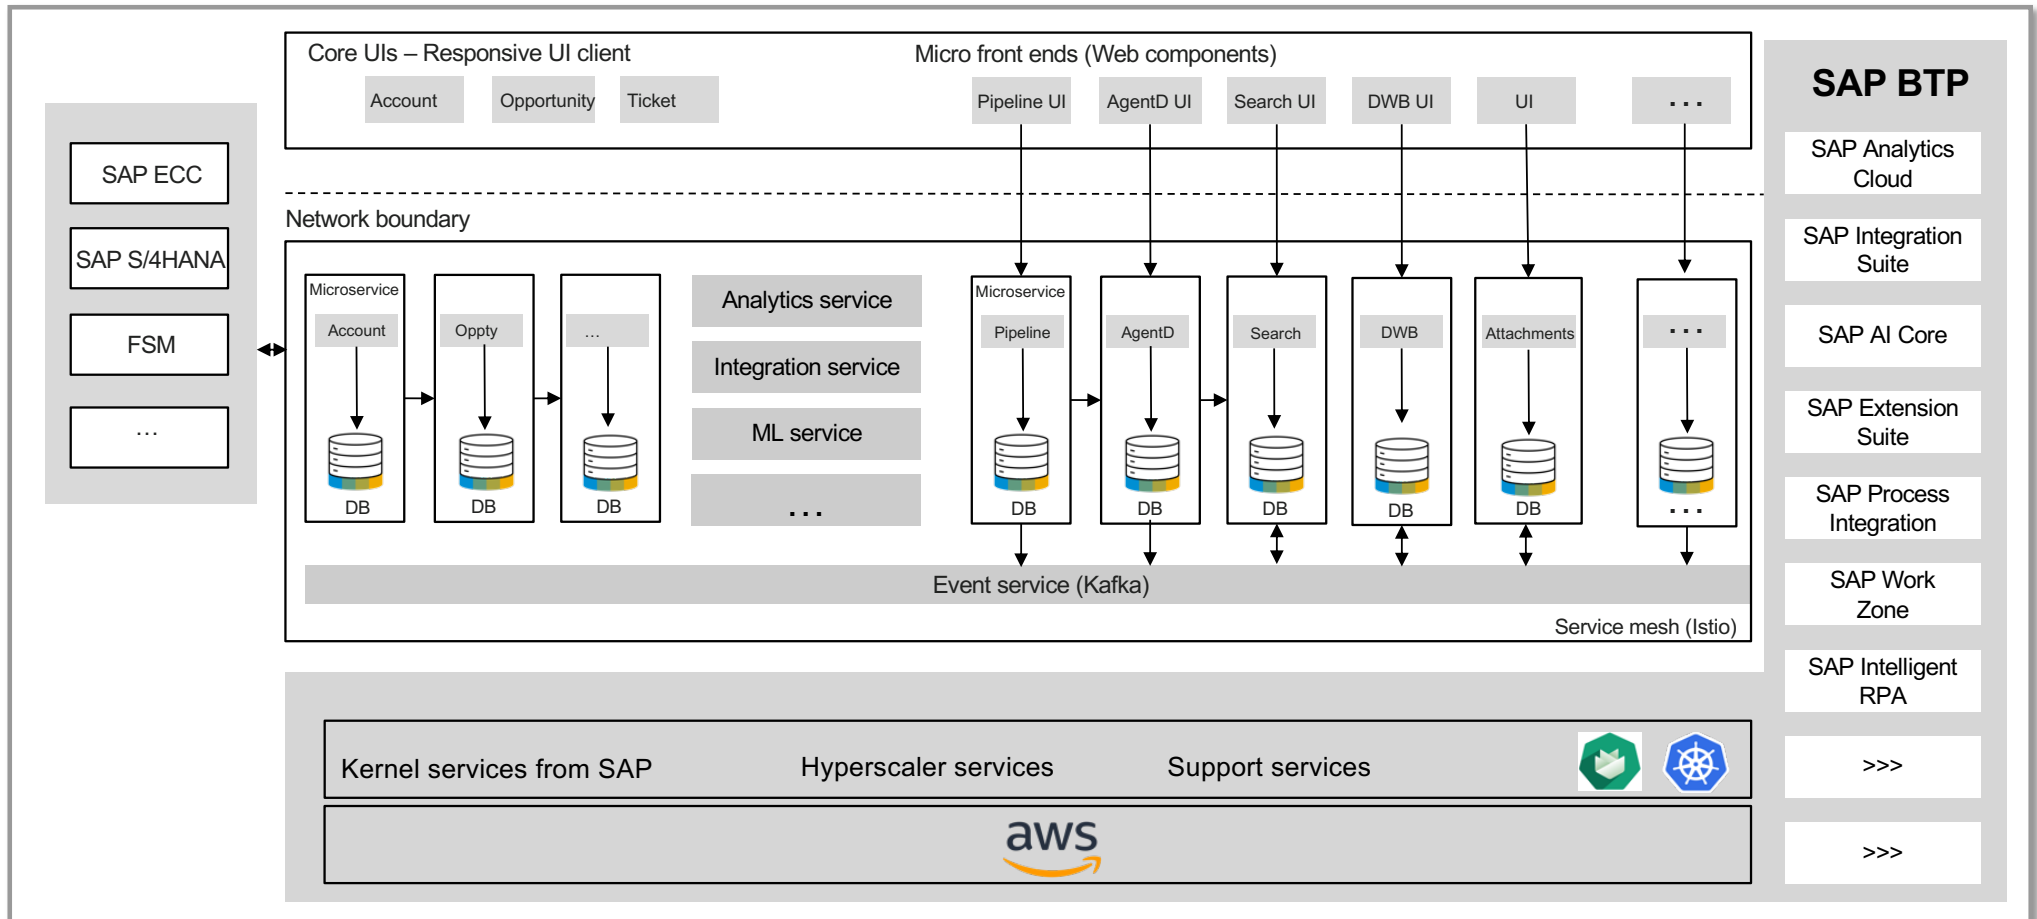

Internal and external insights enabling 360 degree view of customer

- Signals and highlights from CDP², e.g., churn risk, etc.
- Metrics from S/4HANA, e.g., purchase orders, expiring contracts, overdue invoices, etc.
- External insights about customer's business
- External KPIs, dashboards and applications to complete the 360 view

Cloud Native Stack

Platform flexibility to respond with agility to business needs and empower sales and service operations

SAP Service Cloud Version 2

Agent Desktop

- Customer led insights
- Interaction/activity timeline
- Internal notes
- Knowledge search
- Embedded inquiry flows

Collaboration

- Notifications
- Microsoft Teams integration

Insight through Real-Time & Predictive Analytics

- Analytics Cloud embedded
- Embedded & custom dashboards and reports
- KPIs, embedded & ad hoc reporting
- Local & global administration

Productivity

- Global search & filter
- Autoflow & approvals
- Notifications
- Guided flows
- UX & field extensions
- Template management

Data Privacy

- Data disclosure
- Data depersonalization
- Data Retention (employee)
- Change History

Solution Finder

- SAP Knowledge Central by Nice*
- SAP Build Work Zone integration
- Integrate with existing knowledge base
- Context-sensitive recommendations
- Easily share content with customers

Channel Orchestration

- Widget based CTI integration with preferred vendors (phone, chat, messenger, social, bot, etc...*)
- Multisession
- Email management (native)
- Self-service extensibility with API
- IOT* extensibility via API

Integration brings quick time to value*

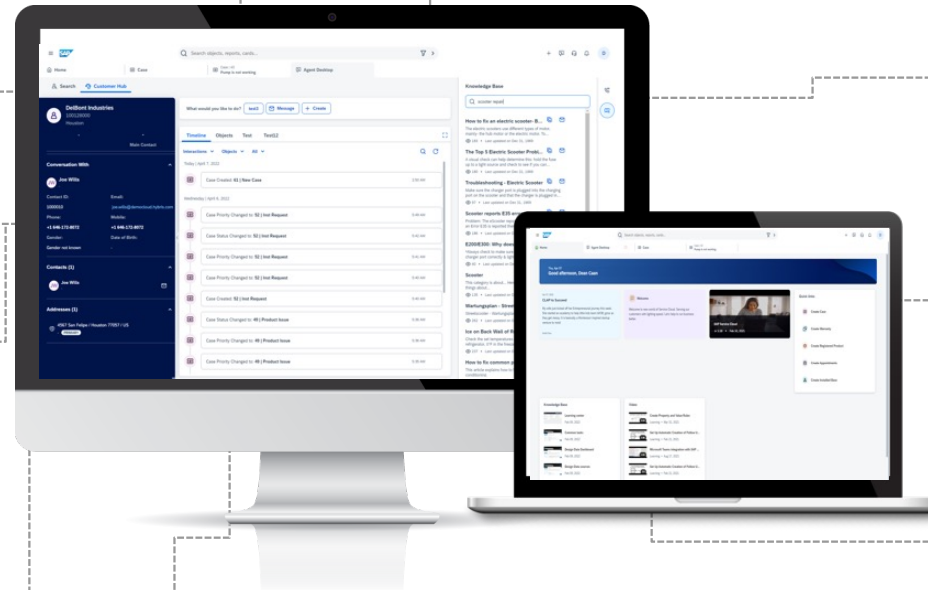

- SAP Solutions: S/4HANA, CX, SAC
- SAP BTP
 - Intelligent technologies
 - SAP Build Apps
 - Integration suite

Service Analytics

- Standard delivered SAC User Stories
 - Case Insights
 - Agents Performance Metrics
 - Case Escalation Metrics
 - SLA Compliance Metrics

Case Management & Case Designer

- Case Routing
- Workflows, notifications, approvals
- Visual designer
- Types, steps, phases, tasks
- Status, notes
- Service level agreements
- AI driven
- Installation management

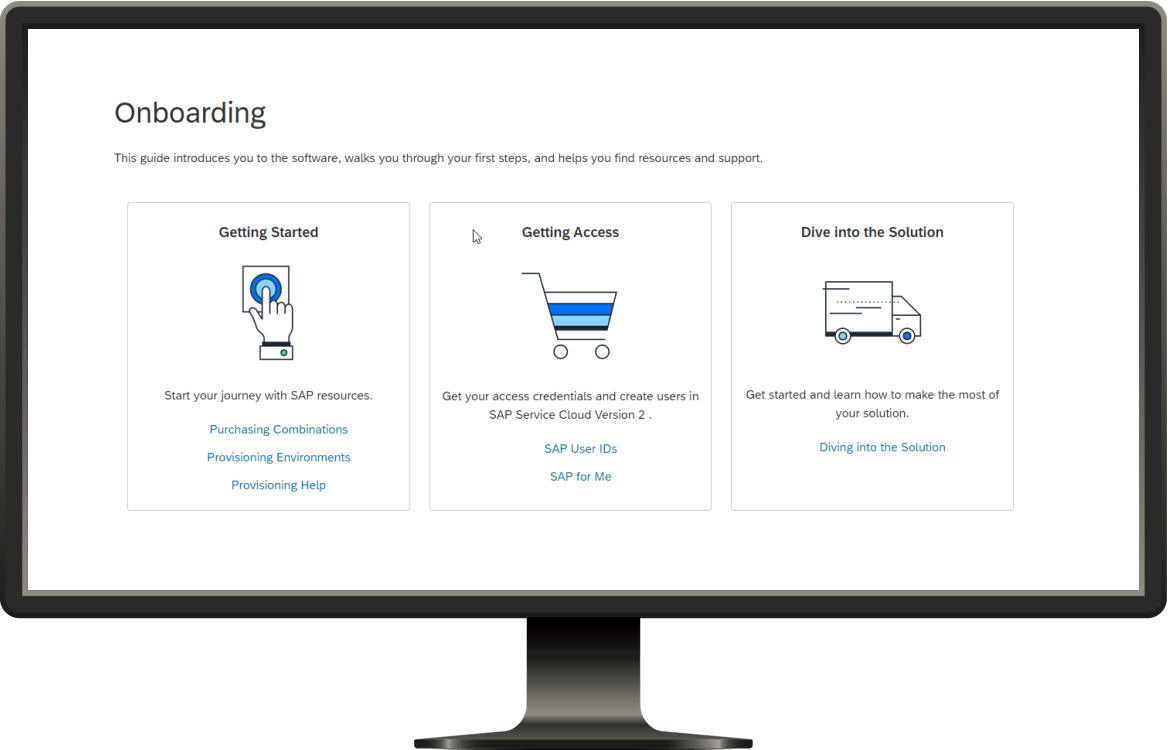

*Additional license required (SAP or Partner solution)

2) Onboarding

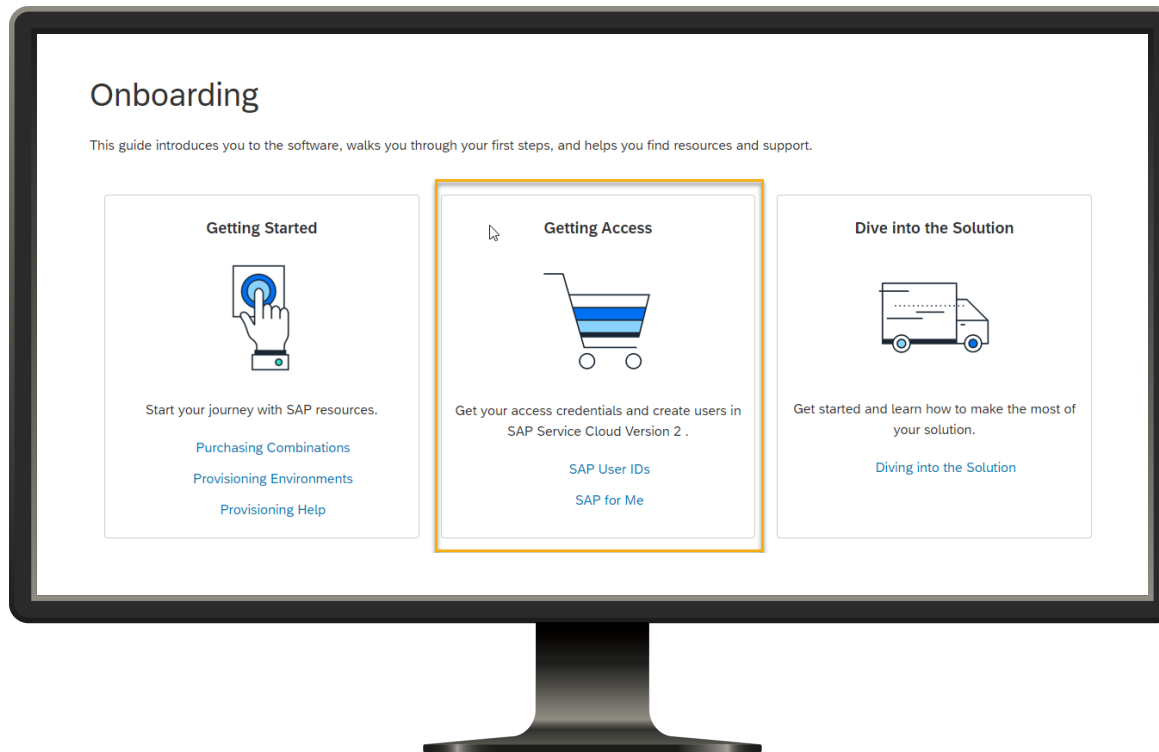

Onboarding

[Link to Onboarding page](#)

Onboarding | Getting Access

How to get the access credentials and create users in SAP Service Cloud V2?

First, nominate a person within your company to become the first user with super administrator or security manager permissions. This person will be responsible for setting up the other users and their permissions.

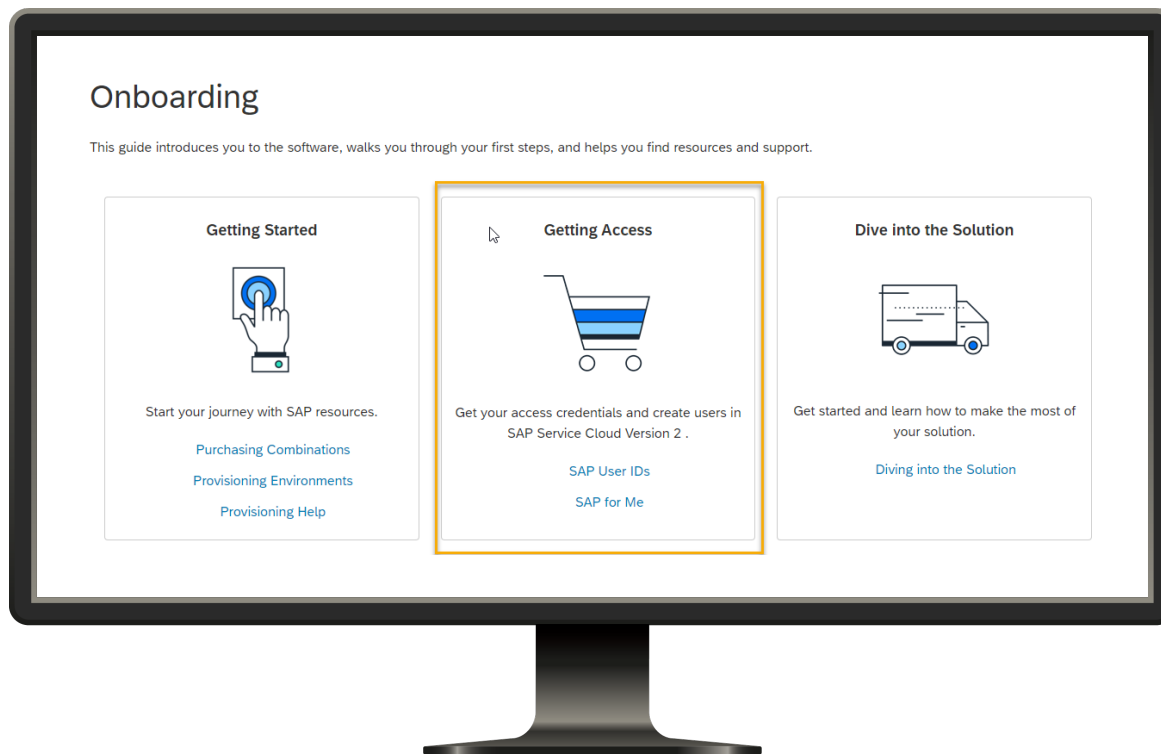

Second, get your login and set up your team members' logins to access SAP products, services, support, and resources.

Do you already have an SAP User ID?

In case you do not, here is how you can get one:

- For Customers go to this [link](#)
- For Partners go to this [link](#)

Onboarding | Getting Access

SAP User IDs

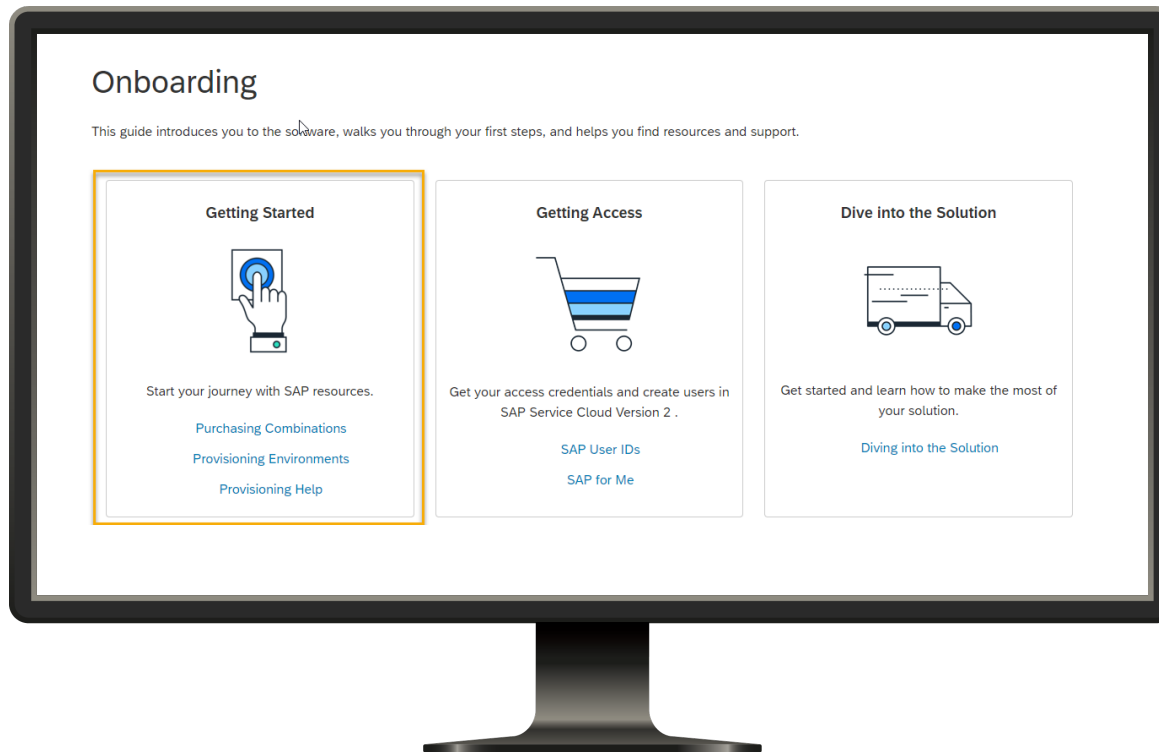

SAP creates the first user for your company.

The first user is then responsible for all user management, including assignment and removal of authorizations to other users.

Support Launchpad Access

Set up your access to the SAP One Support Launchpad where you can download software, get support, report issues, and consult known issues.

Onboarding | Getting Started

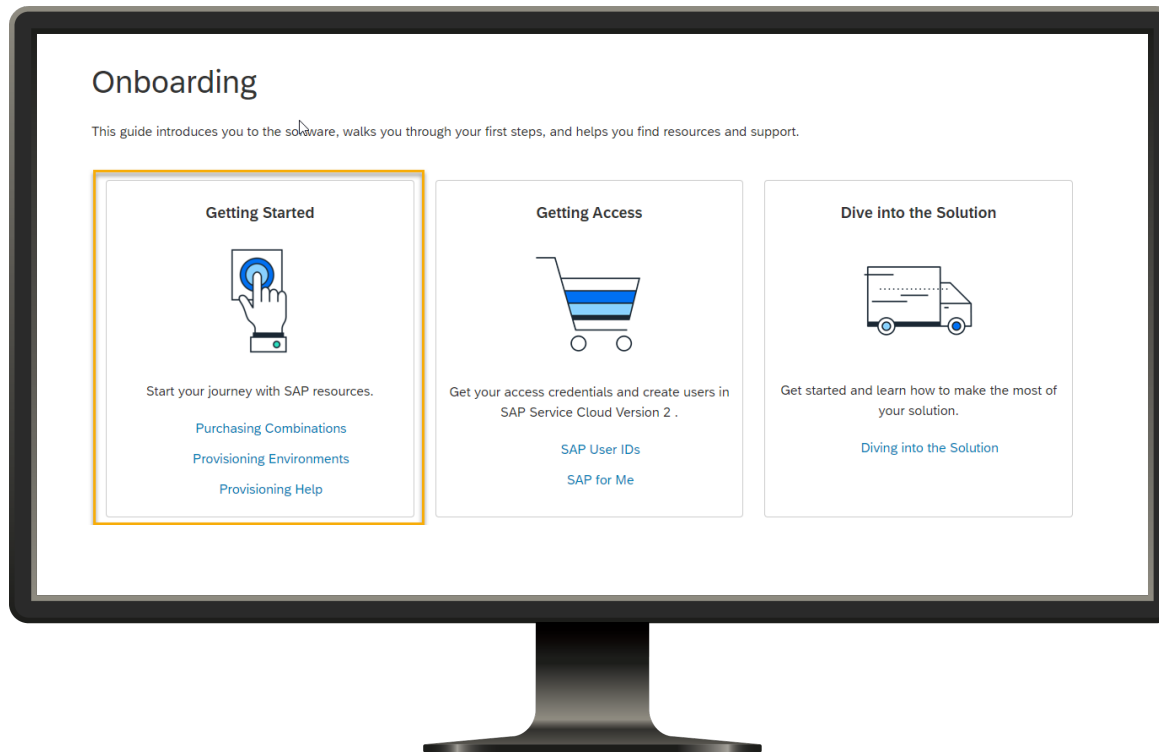

How do you get the tenant URL for your SAP Service Cloud V2?

Provisioning environments - All the new customers of SAP Service Cloud Version 2 can provision the required environments using the service provided in the **SAP for Me** customer portal.

Prerequisite – you have an S-user ID

Go to [SAP for Me](#) and follow the instructions [here](#).

Onboarding | Getting Started

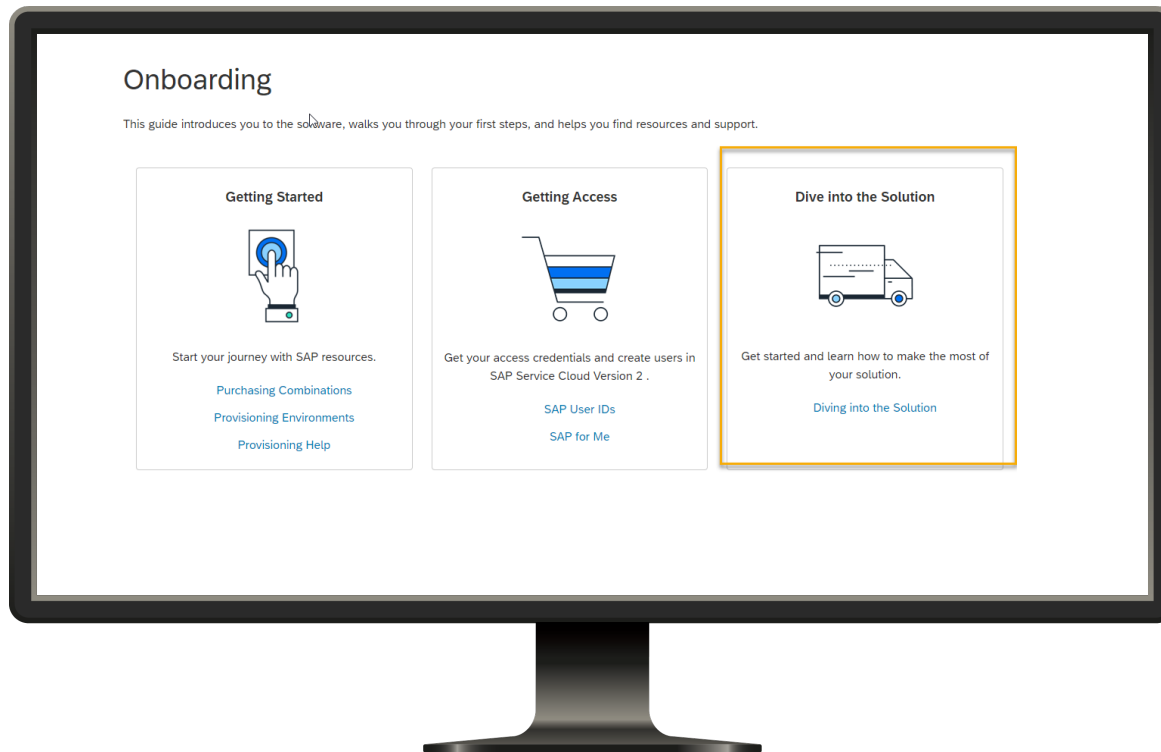

How do you get support, how can you open and manage incidents?

Provisioning Help - how to identify and resolve issues, and where to get additional help.

Prerequisite – you have an S-user ID

Go to [SAP for Me](#) and follow the instructions [here](#).

Onboarding | Dive Into the solution

3) Fundamentals

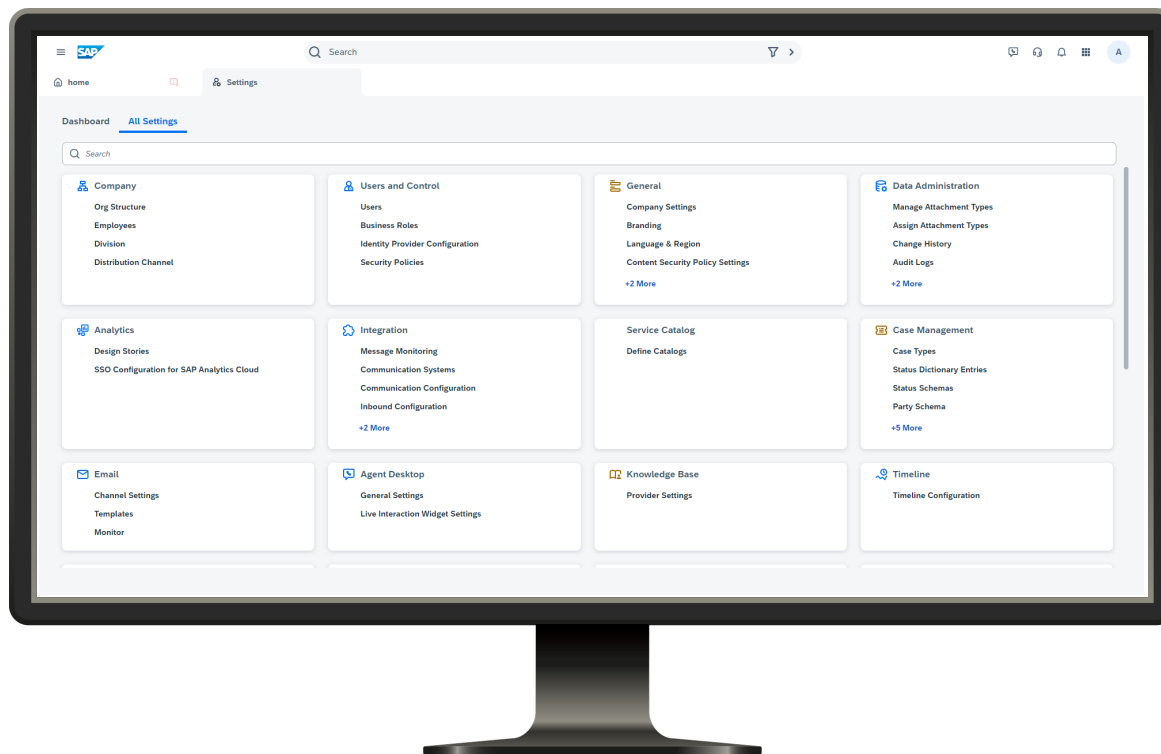

Set-up – How does it work?

No more scoping questions

To perform the system configuration of the new SAP Service Cloud V2, AMDIN users can access the dedicated options from the **User Menu -> Settings -> All Settings** at the top-right corner of the screen.

Set-up – How does it work?

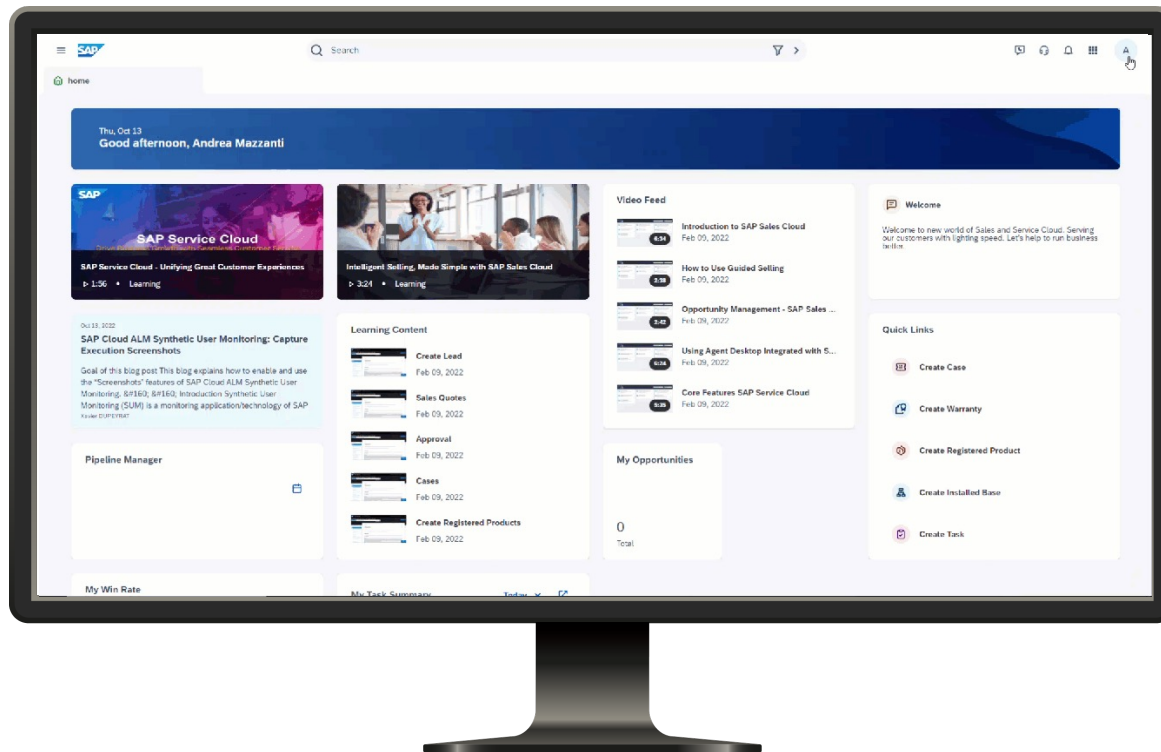

In SAP Service Cloud V2 the configuration does not require ADMIN users to enable any business scope option, nor to answer any scoping questions.

ADMIN users can find all available settings in one single screen.

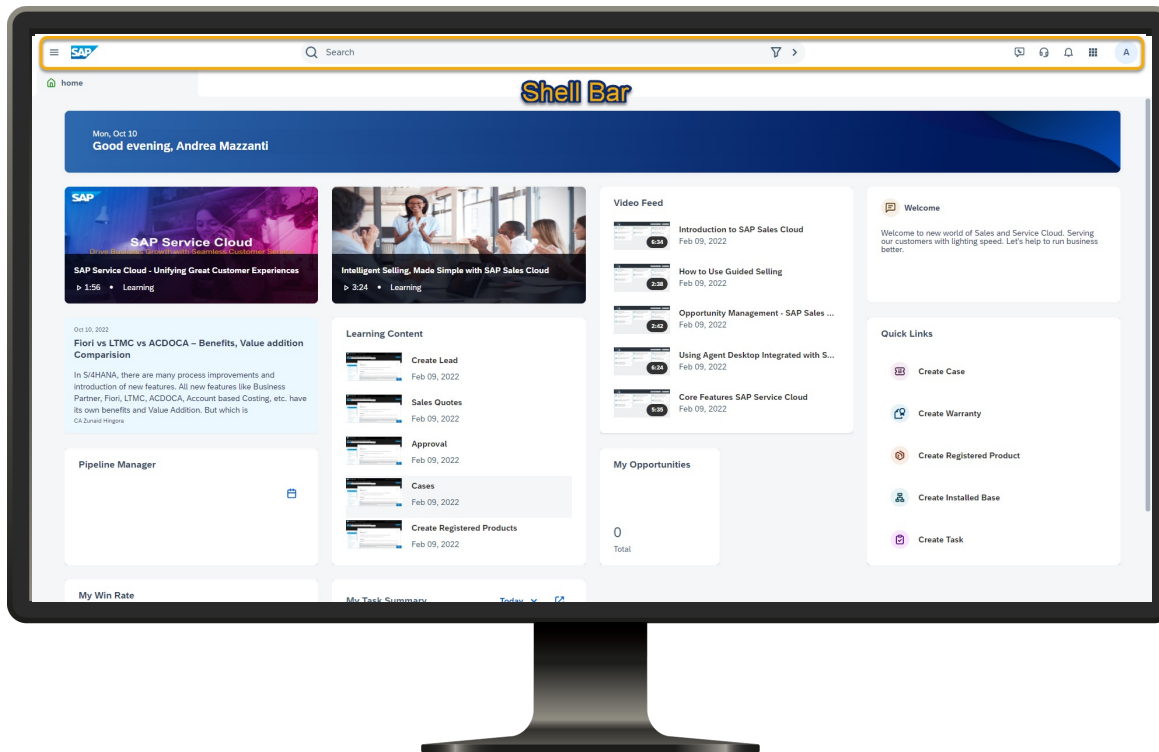

There is also a **Search** field where ADMIN users can type in key words and jump directly into the corresponding configuration card, see an example in the next slide.

Set-up – How does it work?

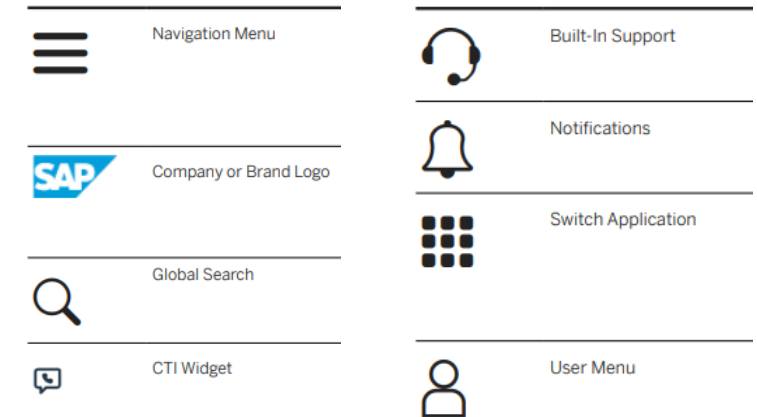

By typing “***timeline***” in the search help, ADMIN users can easily find the corresponding configuration cards and access them in one click.

Common Tasks | Shell Bar

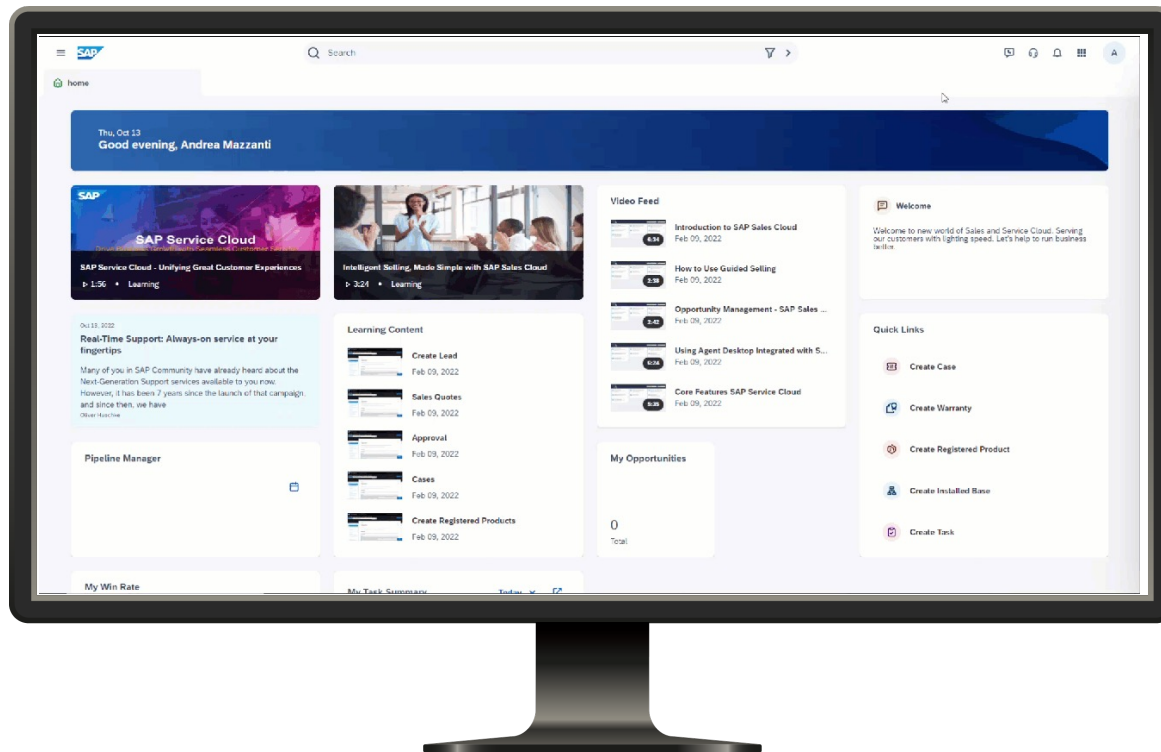

Knowing the common tasks such as **Navigation Menu**, **Search**, and so on, it is critical in managing the data within SAP Service Cloud V2.

Shell Bar: the horizontal header that contains User Menu, Plugins, and Logo.

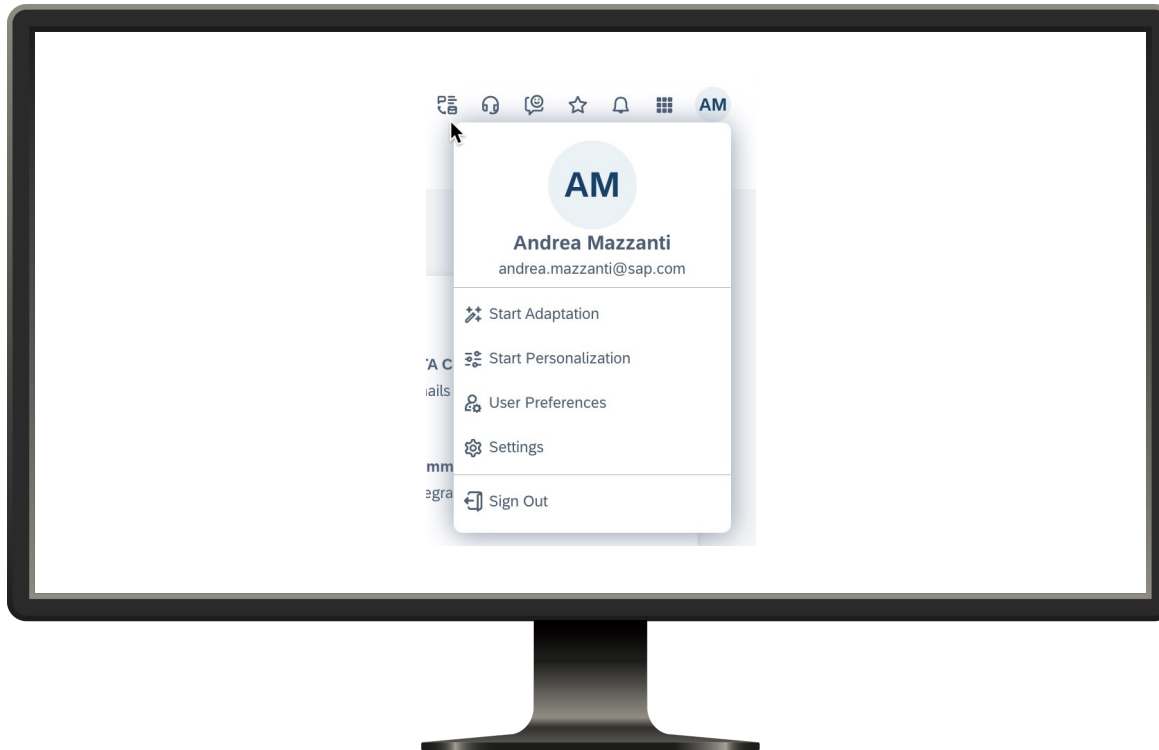

Common Tasks | Access to CTI & others

From the **Shell Bar** users can easily access to the following:

- The CTI widget (if configured)
- The Built-in support
- The Notifications
- The User Menu where depending the on Business Role, they can access:
 - Start Adaptation
 - Settings

Common Tasks | Start Adaptation

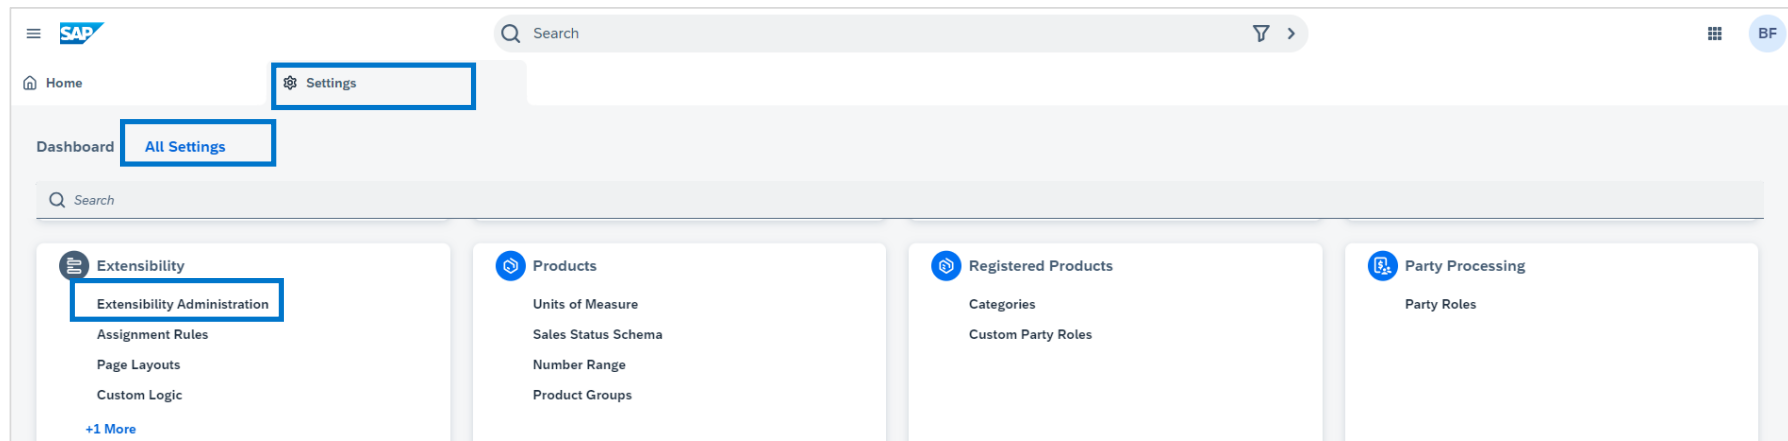

ADMIN users can change the look and feel of the solution for all users by changing layout settings, adding mashups and fields, as well as defining extension fields.

Here is a list of which customizations are available:

- Manage fields (hide, add, reorder fields)
- Add extension fields
- Add and manage sections
- Add Mashup to custom sections
- Create custom buttons
- Create and manage custom tabs

Exercise – Create and Add an Ext Field

Exercise – Create and Add an Ext Field

To add fields, select the add from list icon () to bring up the fields available in the entity. Find the Extensions node in the list and drill down inside the structure to view the list of available extension fields.

Fundamentals | Global Search

 **Global Search**

[Filter Configuration](#)

[Search Admin Settings](#)

Global Search | Filter Configuration

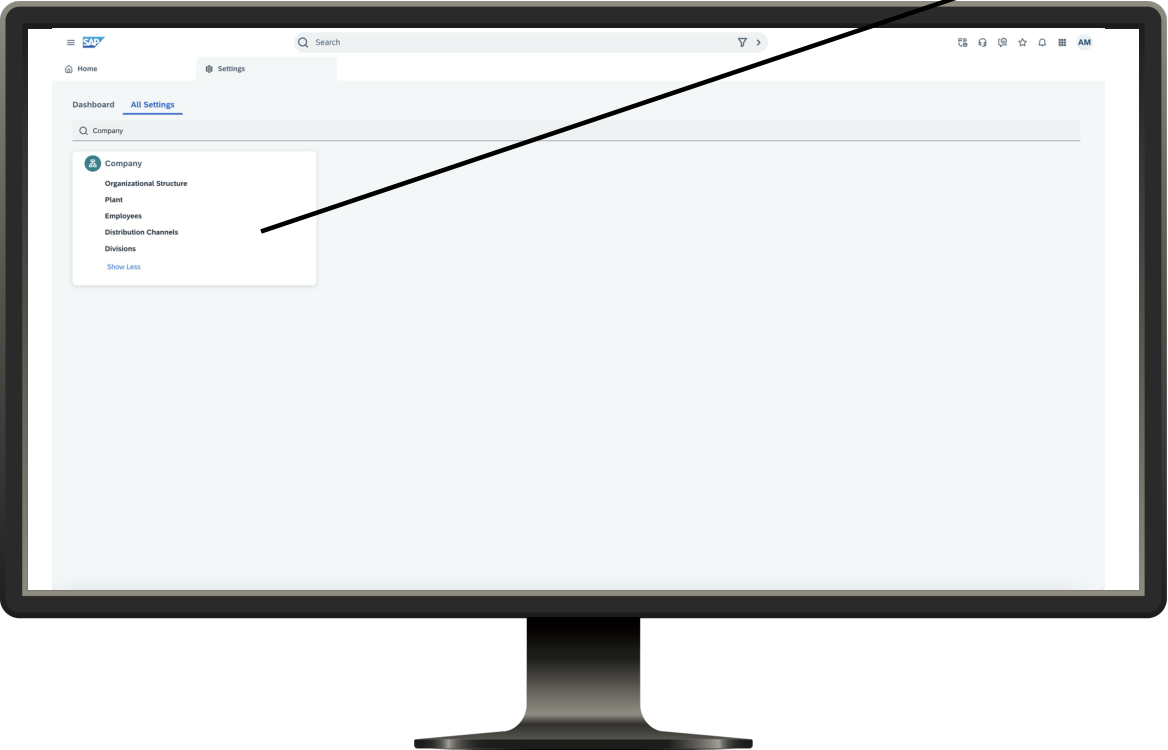

With the **Global Search**, users can search for entity details across SAP Service Cloud V2. Currently, the available entities for search are:

- Cases
- Individual Customers
- Installed Bases
- Registered Products
- Installation Points
- Library
- Accounts

Filters Configuration: ADMIN users can define filters and make them visible for users in the advanced searches for the currently available entities.

1. Navigate to **Settings -> All Settings -> Filter Configuration**.
2. From the left pane, select the entity you want to configure.
3. Use the Add (+) button to add a new field.
4. Optional: Click Reset to erase all the fields in the predefined configuration.
5. Click Save once you have created a new filter configuration.

Home Page

Feature Activation Hub

[Show Less](#)

System Preferences | Appearance & Behavior

Appearance includes Themes properties.

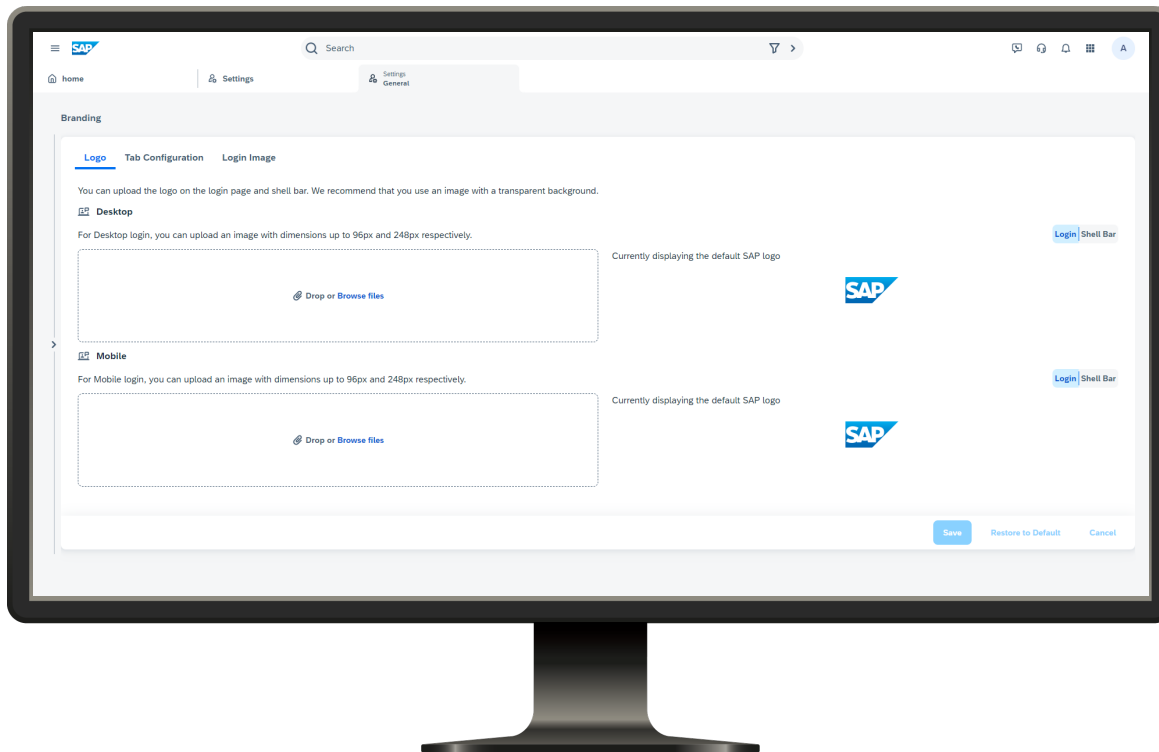

Behaviour is applicable for all users or selected Business Roles and it includes **Auto Sign-Out** and **Tab configuration**.

Auto Sign-Out: for security reasons, users are automatically logged off from the system if they've been inactive in the system for a certain period.

- ADMIN users can leave this option empty and all inactive users will be logged off from the system after 1 hour.
- ADMIN users can also set the auto log off time for selected Business Roles.

Tab Configuration: it allows ADMIN users to choose which default screen should be displayed when all Tabs are closed

System Preferences | Branding

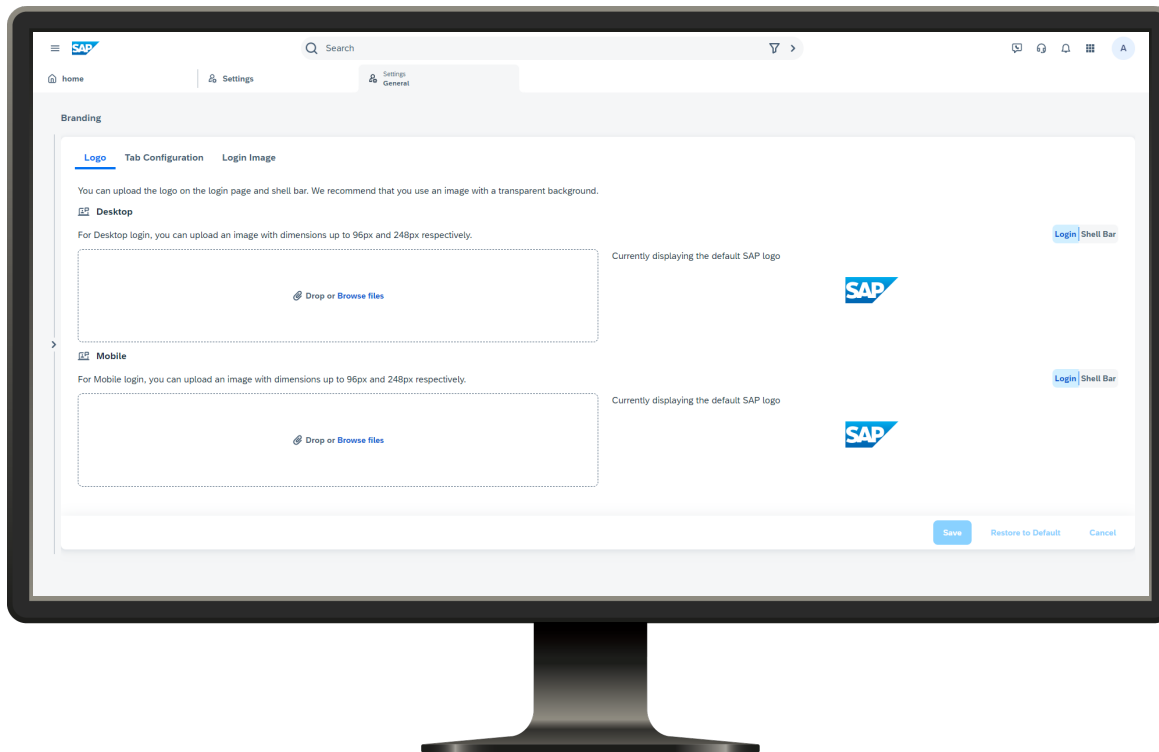

With **Branding** ADMIN users can adapt the look and feel of their SAP Service Cloud V2 solution to suit their company's need.

As an ADMIN user, you can adapt the company logo and related settings in the title bar. You can also set the background screen for your SAP Service Cloud V2 solution. The changes will be visible to all users the next time they log on to the system.

To use this feature, navigate to **User Menu -> Settings -> All Settings**.

Select **Appearance and Behavior** under **Branding** or search for branding in the search field and select from the result.

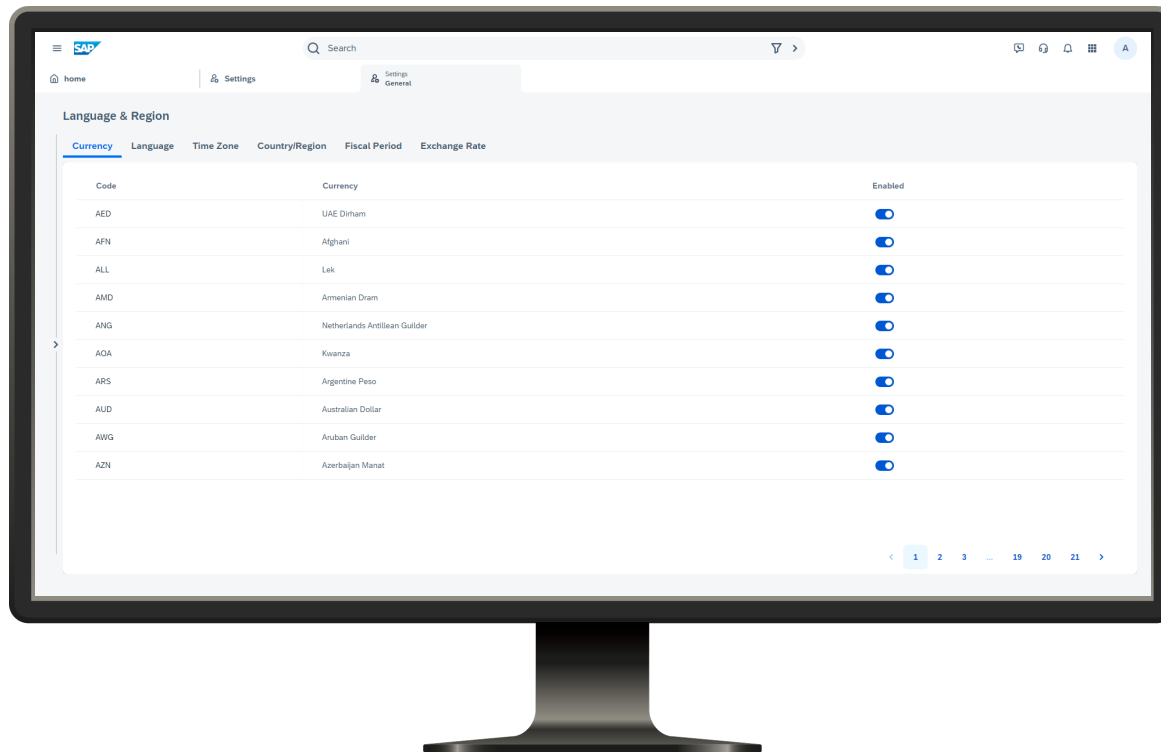

System Preferences | Company Logo

The **Company Logo** can be adapted by following these steps:

- To upload a logo on the login page for desktop, in the Logo tab, you can do any of the following under Desktop:
 - Drag and drop your image file to the field.
 - Click Browse files and select an image file.
- To upload a logo on the shell bar for desktop, select Shell Bar on the right side of the screen and upload the image file.
- Similarly, upload a logo on the login page or shell bar for mobiles.
- Click Save.

System Preferences | Language & Region

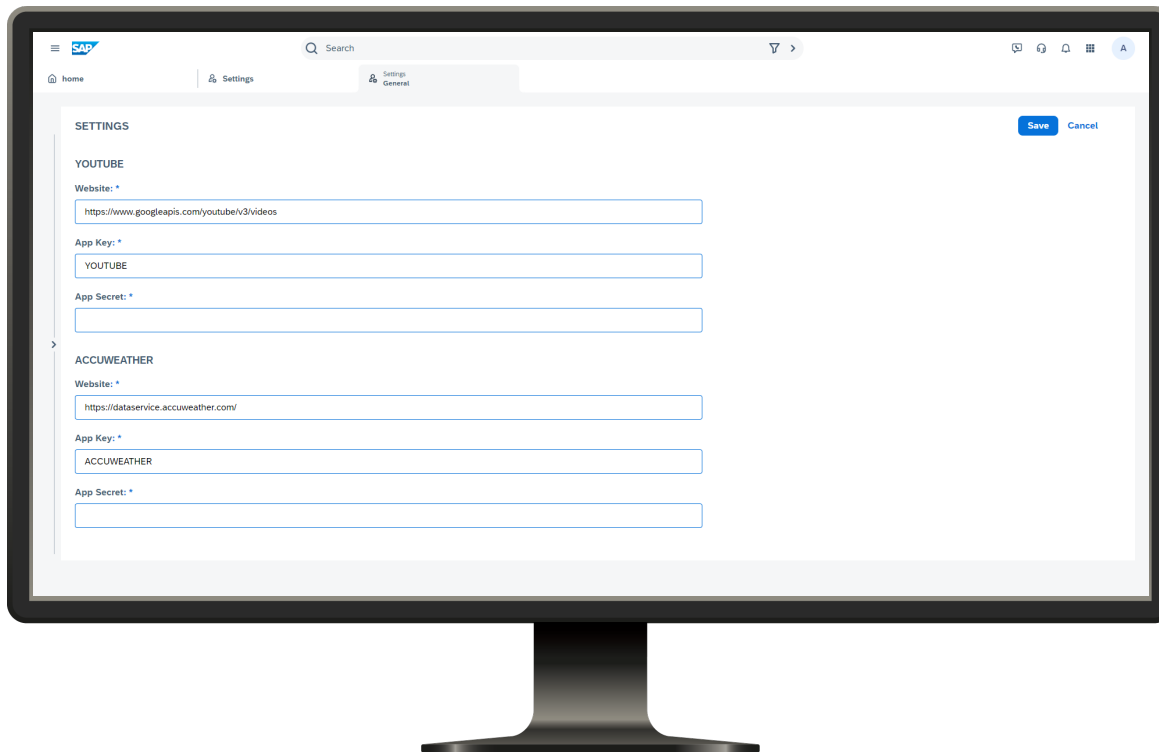

The **Language & Region** can be adapted for all users by following these steps:

On the Language and Region page, ADMIN users can configure the following tabs:

- Currency
- Language
- Time Zone
- Country/Region
- Fiscal Period
- Exchange Rate

System Preferences | Home Page

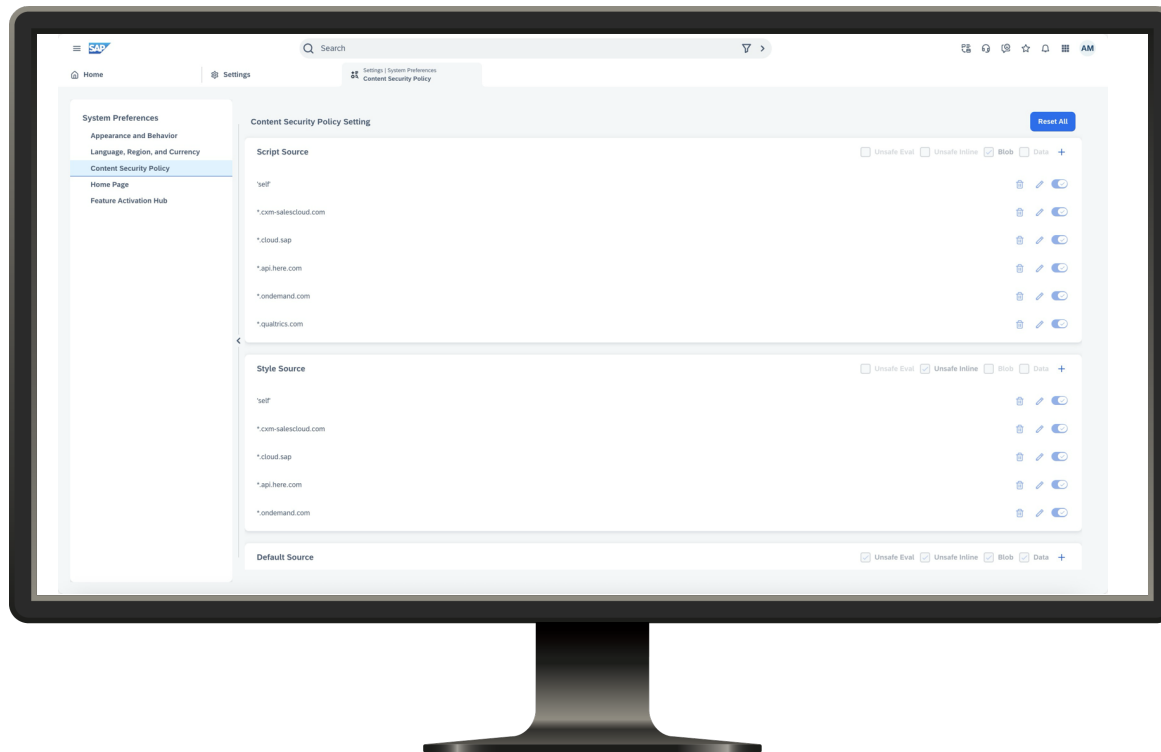

Home page is the default start page, typically the first thing users see after logging in. Home page displays preconfigured business cards.

The following cards can be displayed:

- **Greeting Card:** Shows a greeting message to the user along with the current date, and the weather condition
- **Message Card:** Shows messages for the business users
- **News Card:** Displays news one after the other based on the RSS feeds
- **Video Thumbnail Card:** Appears on the home page with the pre-delivered video thumbnail
- **Quick Links Card:** Serves as a launch pad for different quick create pages within the solution. Quick links card on home page shows the object icons and the object names that help you to navigate.
- **Learning Content Card:** A list of five useful articles that help you understand the solution.
- **Video Dashboard Card:** A list of five useful videos that help you understand the solution.

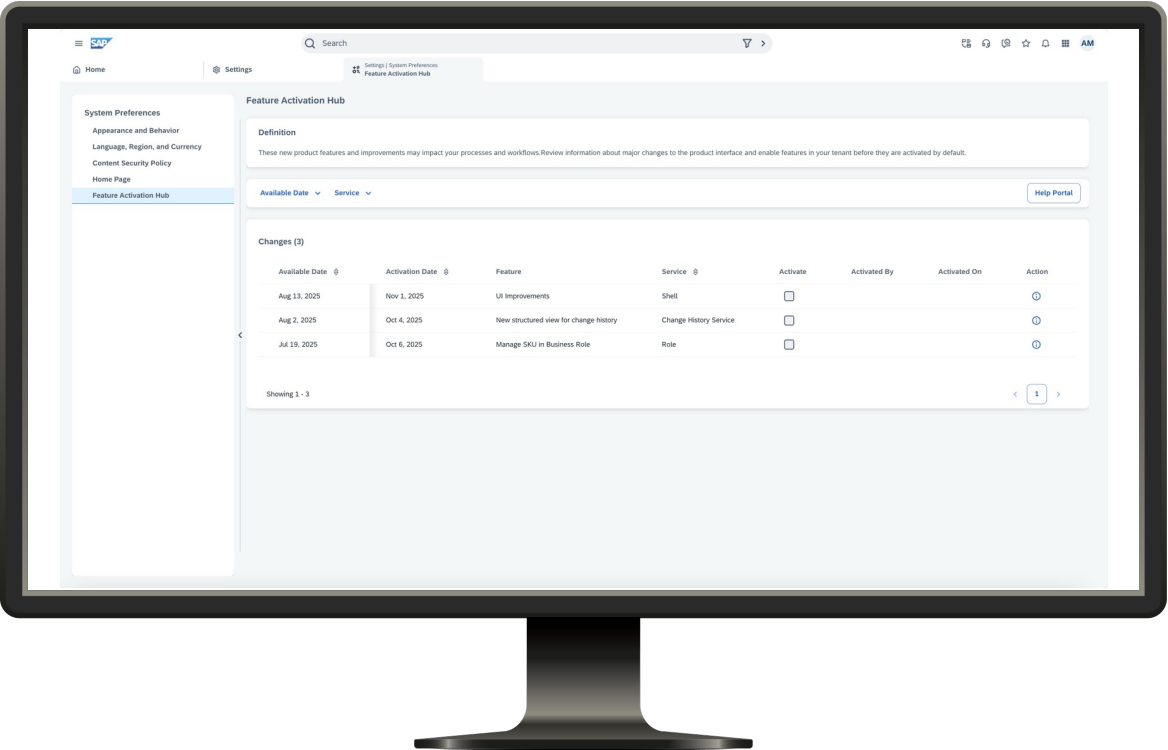

System Preferences | Content Security Policy

A **Content Security Policy** (CSP) is a security standard that provides an additional layer of protection from cross-site scripting (XSS), clickjacking, and other code injection attacks.

The solution ships with default settings to provide additional security protections. For enhancements and integrations, ADMIN users can modify the settings or add additional settings if needed.

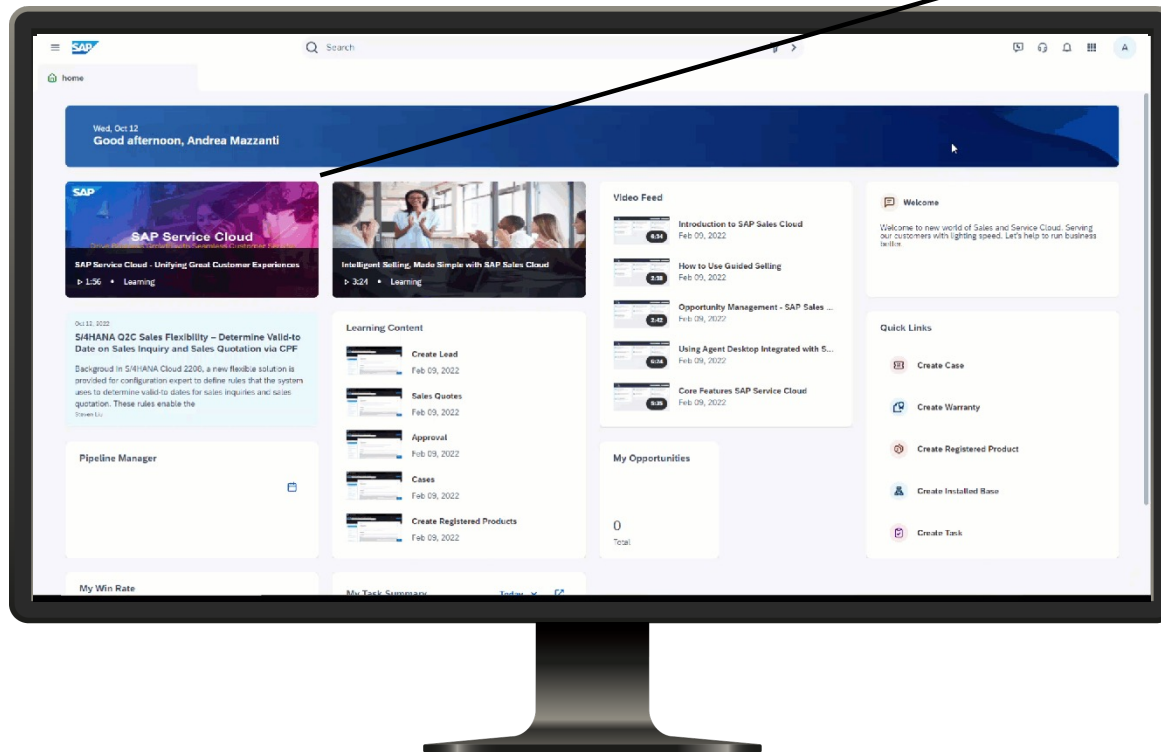

System Preferences | Feature Activation Hub

The new Feature Activation Hub allows you to review and activate new system features.

You can activate features that offer new capabilities or enhance productivity if they benefit your organization before they're activated in all systems.

Fundamentals | Business Alerts

 **Business Alerts**

Alert Types

Alert Groups

Fundamentals | Business Alerts

Business Alerts generate proactive report about important business information, enabling teams to stay informed about critical business situations.

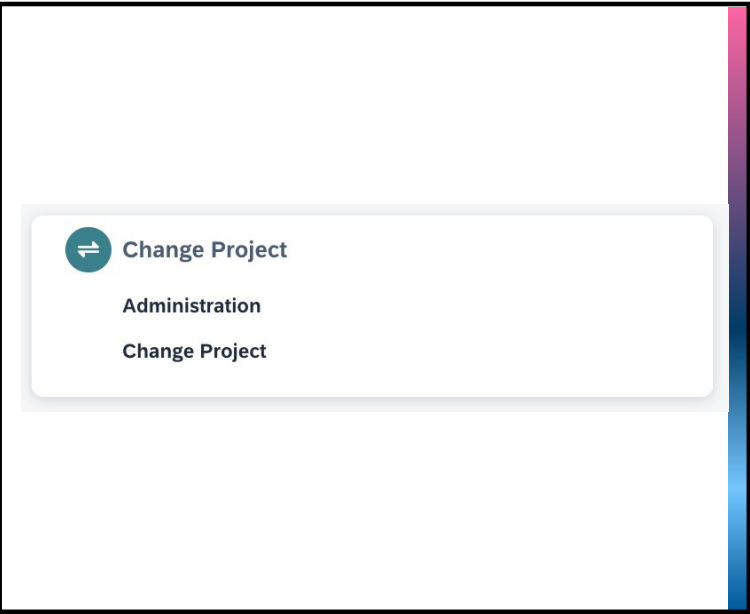

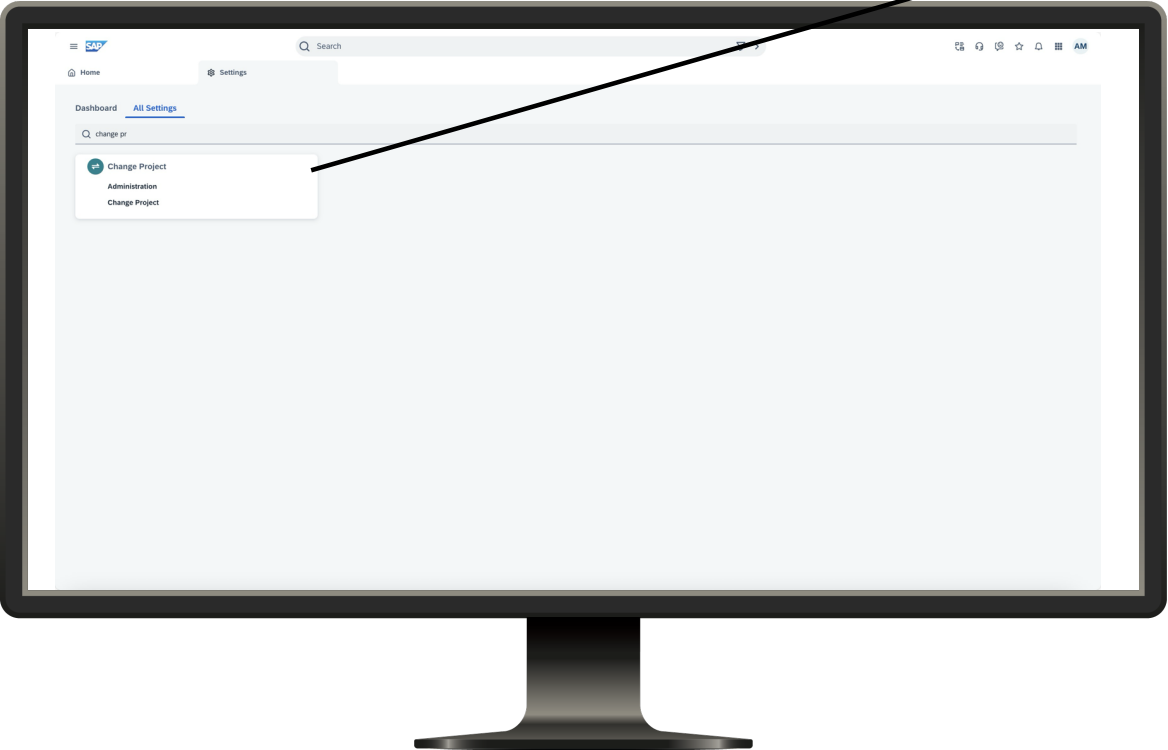

These alerts ensure that key updates are communicated promptly, enhancing operational efficiency and response time.

Internal alerts allows you to set up conditional rules based on business data to generate proactive updates.

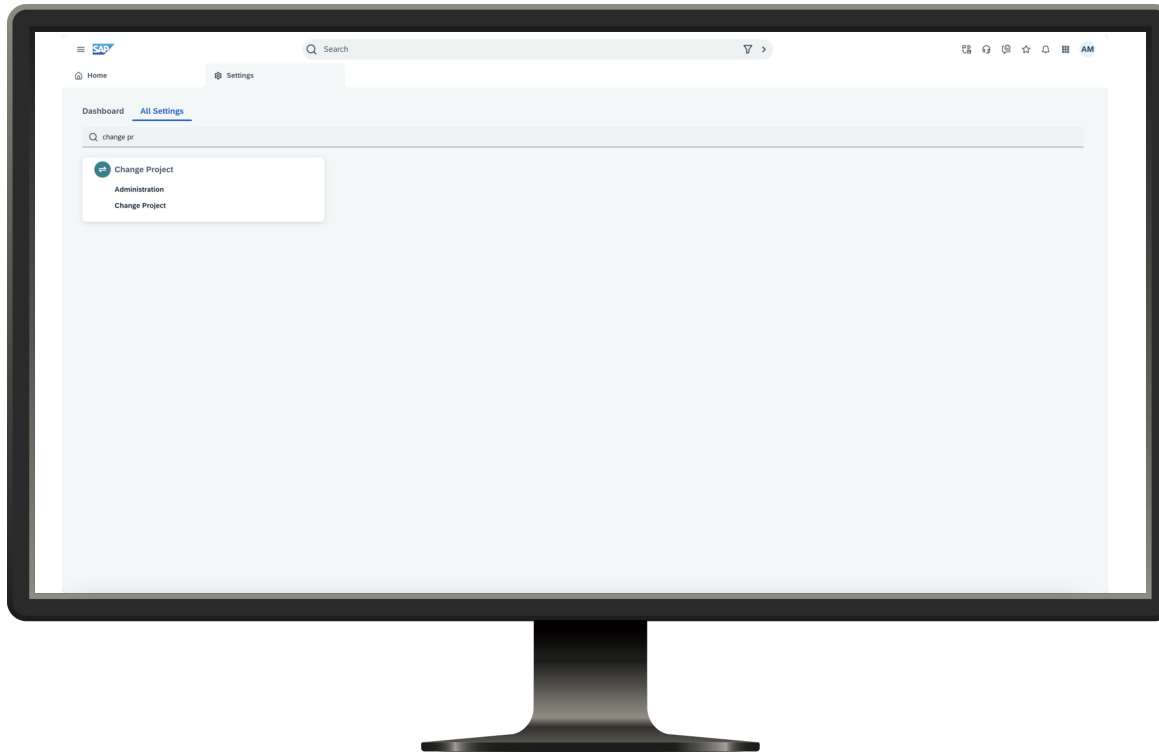

External Alerts reports important business information sourced from external systems.

[Link to page details.](#)

Fundamentals | Change Project

Fundamentals | Change Project

[Change Project](#) allows you to record and transport configuration changes from a source system to target systems.

Changes are recorded on a source system such as a staging system and transported to target systems such as a testing system or a production system. Change project supports multi-tier architecture. You can assign one source and multiple target systems for a customer ID.

4) User and Control

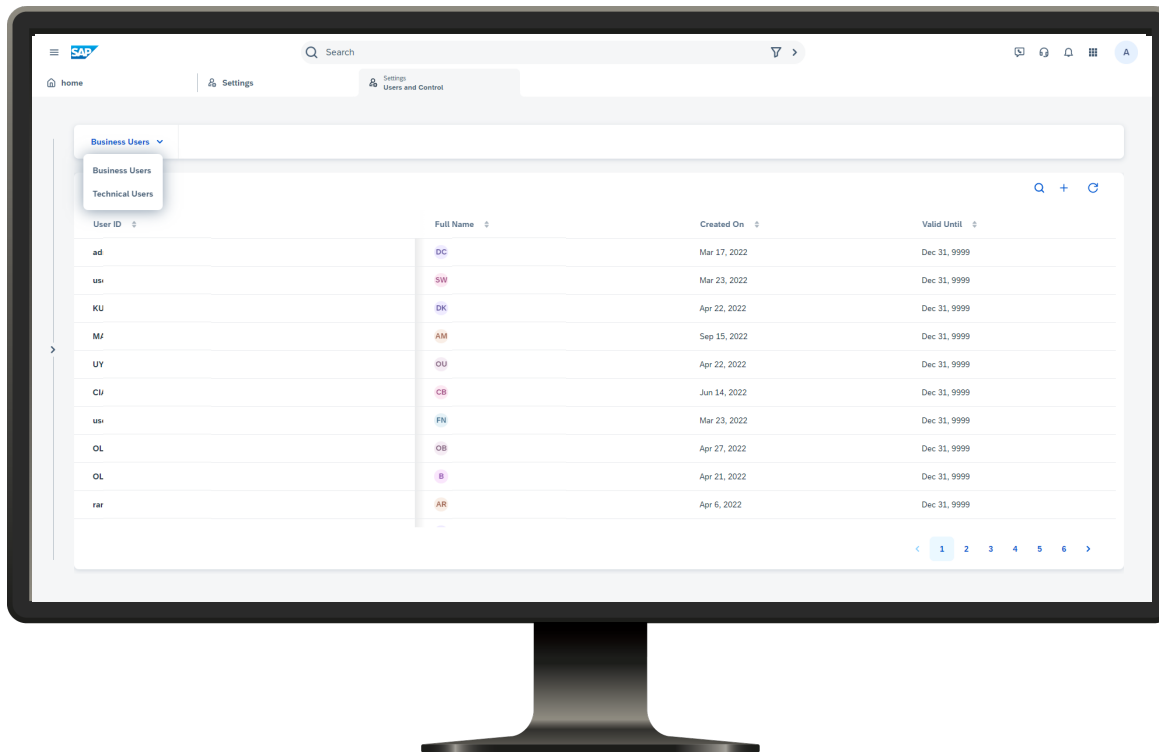

Fundamentals | Users & Control

Users & control allow ADMIN users to manage:

- **Employees:** a group of people who contribute to creating goods or services in a company, based on a work contract or a contract for services.
- **Users:** Refer to employees, business users, and other users such as partner contacts. Users are assigned to business roles and technically, access controls in the system are implemented on the business roles.
- **Business Roles:** Represents a set of authorizations to access the solution. In the system, a business role defines a hierarchy of access controls that ADMIN can assign to application users in the organization. ADMIN can use roles to assign access to a large number of users at a time. As roles change, ADMIN need to update only the access rights within a role and the rights apply for all assigned users.
- **Security Policies:** A set of rules that defines password complexity, such as including numerical digits and password validity, like requiring a password change after a certain period of time.

Users & Control | Users

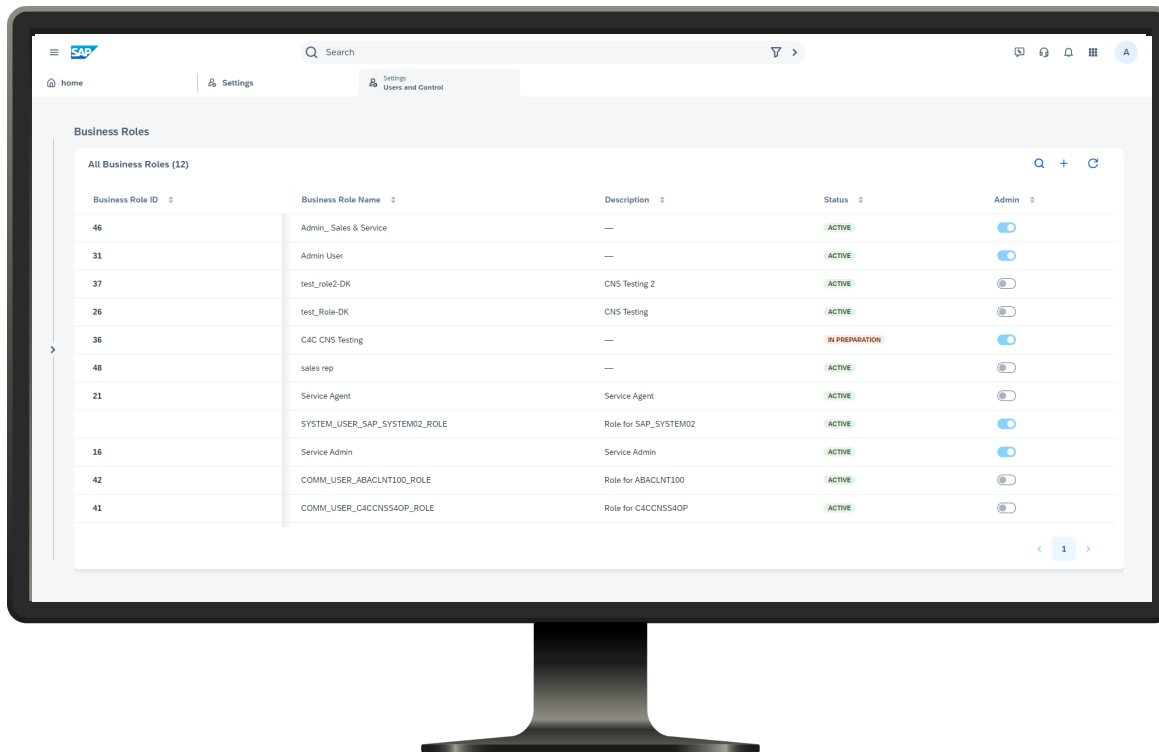

Users are created for employees to access the system. Each business user must have at least one business role assigned that governs the access of the user to the system. Business users in the system are linked to employees.

Create Business Users

1. ADMIN users can go to **All Settings -> Users and Control -> Users**.
2. Choose Business Users from the dropdown on the page.
3. Click the add icon (+) on the Business Users page.
4. Search and select an employee for whom you wish to create the business user.
5. Once you select an employee, the User Data section is auto-populated. By default, the user ID is created with the last name followed by the first name of the employee.
6. Once you've verified all the details, click Create. The business user is now created and linked to the employee. Refresh the business users' list to view your newly created business user.
7. Choose your business user, and then navigate to the Assigned Business Roles tab.
8. Add business roles to your user by using the Search and Add functionality on the screen. All the business roles that you assigned to your business user now appear in the list format on the Assigned Business Roles tab.

Users & Control | Business Roles

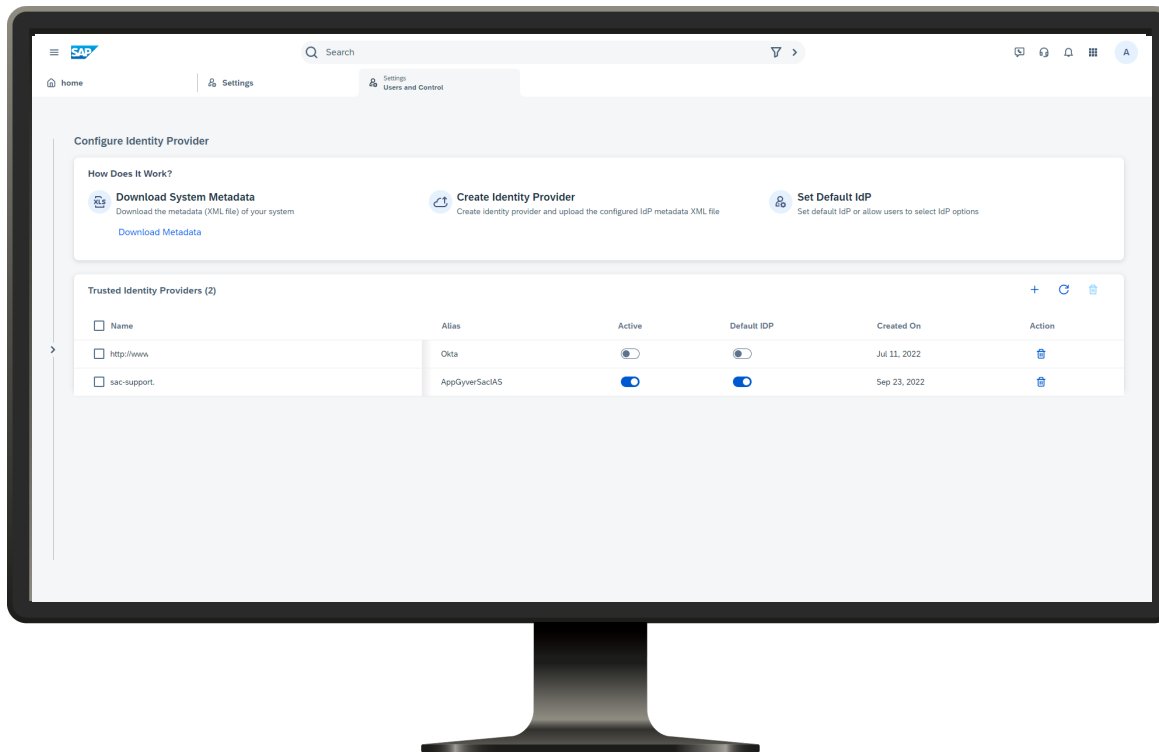

AMIND can use **business roles** to assign access rights to multiple business users who carry out similar activities. ADMIN users can also define access restrictions in a business role.

Go to **All Settings -> Users and Control -> Business Roles**

1. Click the add icon (+) on the Business Roles page, and enter the business role name and description.
2. The Business Role ID is auto-generated. You can also set this role as an admin role by enabling the Admin toggle.
3. Click the Add Business Services button, select all the services that are required for this role from the list of services, and then click Add. You can now Save and Activate your business role.
4. Once the business role is saved, the App List section is now visible, which displays all the available apps for the selected business services. Select the toggle button against the app to make it available for the business role.
5. Set restrictions for a role using Read Access and Write Access columns in the Business Services section. By default, both these columns are set to unrestricted for a service, and the Restriction Rule is set to unassigned.
6. Change either or both Write Access and Read Access to Restricted, and click Unassigned to create a restriction rule. Select options from the list for creating a restriction rule for the selected service.
7. Navigate to the Assigned Users tab. A list of users who have been this role assigned is displayed. If there are no business users assigned yet, the Search and Add Users button is visible.
8. Click the Search and Add Users button to add business users from the quick view. Search and select users from the quick view to add them to the role.

Users & Control | Identity Provider

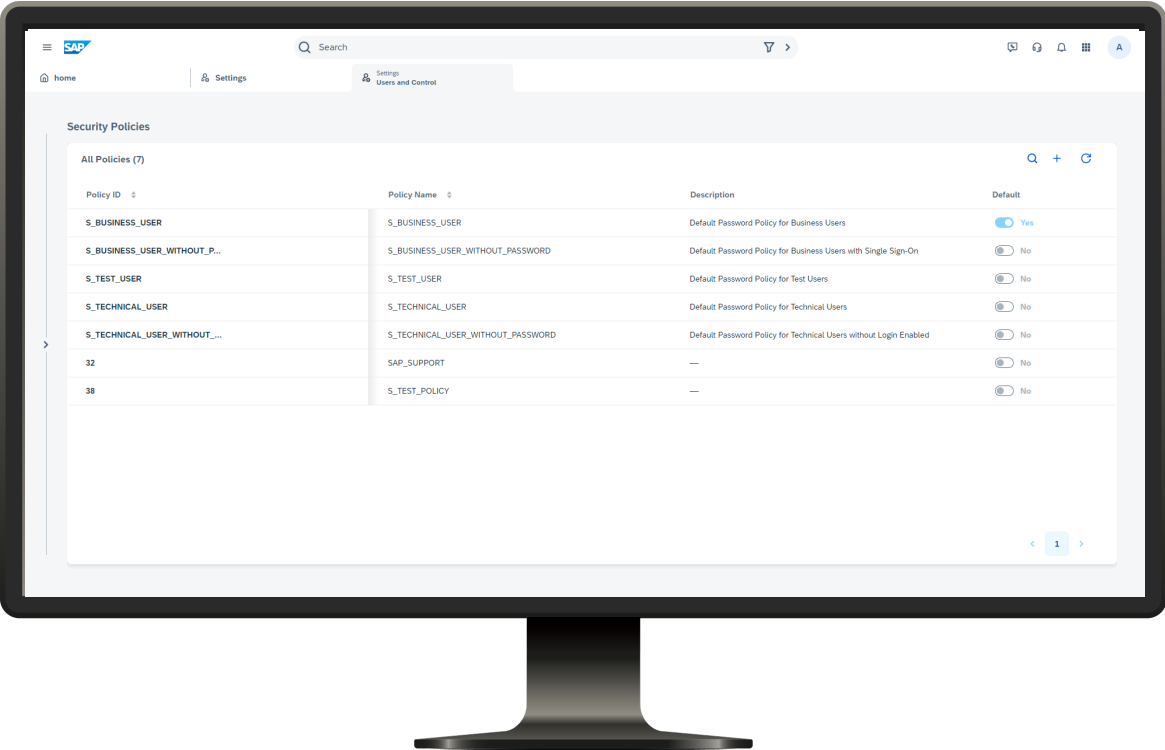

ADMIN users can configure **identity provider** to enable single-sign on for the system.

To enable **Single Sign-On** for the system, ADMIN users have to connect the identity provider to the system.

To do so:

- download the metadata of your system
- upload the metadata XML file to your identity provider
- download the configured metadata from the identity provider.
- choose the identity provider and create the identity provider to start using the system

Users & Control | Security Policy

A **security policy** is a set of rules that defines password complexity, such as including numerical digits and password validity, like requiring a password change after a certain period of time.

ADMIN users can define multiple security policies because work areas or departments of a company may have different password security requirements. As an ADMIN user you can manage the security level, if desired, by editing and enhancing the security policy, for example, by changing the complexity and validity for all passwords, in accordance with your company's security requirements

5) Master Data

Organizational Structure - Maintenance

Within the Company settings, ADMIN users can learn to manage employees, create divisions and distribution channels, and create their company's structure. The organizational structure is composed of units and provides a unified representation of the company's organizational data.

Under **Settings -> Company -> Org Structures**, ADMIN can establish the organizational structure as a prerequisite to going live.

The uppermost node of the org structure should be an org unit defined with the Company function. The node directly below the Company node should be either a Sales Organization or a Service Organization. If the company uses both the sales and service functions of the solution, then the org structure will have both types of nodes below the company.

Divisions can be used for defining for example different product lines or different type of services. **Distribution Channels** represent how sellable products and services reach customers, for example wholesale, retail, direct sale.

Employees are represented as business users in the system: for every employee record that is created, a corresponding business user will be automatically created in the system.

Note: All accounts, customers, employees, contacts, partners and competitors are considered as business partners in the system. Therefore, all functions that are common to business partners are applicable to them.

Create Employees

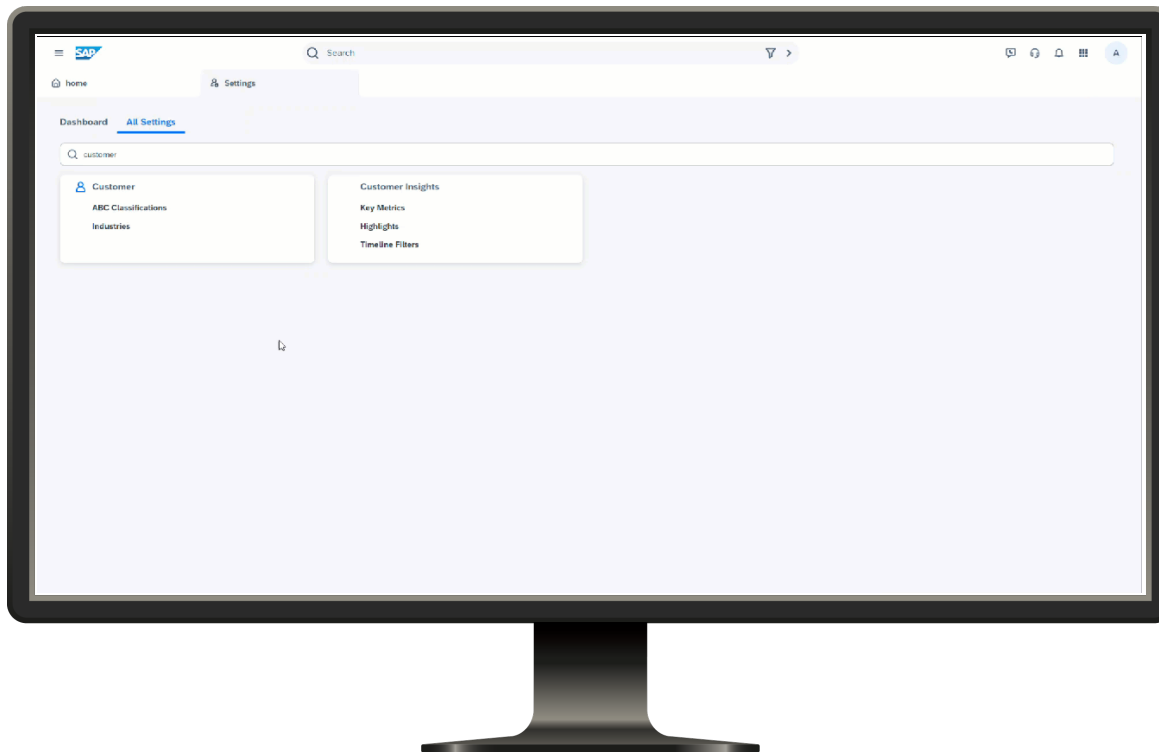

1. Navigate to the User Menu and select **Settings** -> **All Settings** -> **Company** -> **Employees** .
2. In the worklist of the employees view, choose Create
3. Enter as much personal, organizational, and contact information as you require.
4. Choose Save.

Customer Types

CX

Customers		
Three Customer Types	1. Company (referred to as Account) 3. Contact	2. Individual Customer
Three Methods to Create Accounts	1. Manually 2. Migration 3. Integration	
Accounts are Master Data Objects; can include several kinds of Master Data	Kinds of Master Data Examples: Customer ID; Role; Address Data; Contacts; Communication Data; Sales Data; History of Activity (time line); Types of Activity (transactional data)	

Account

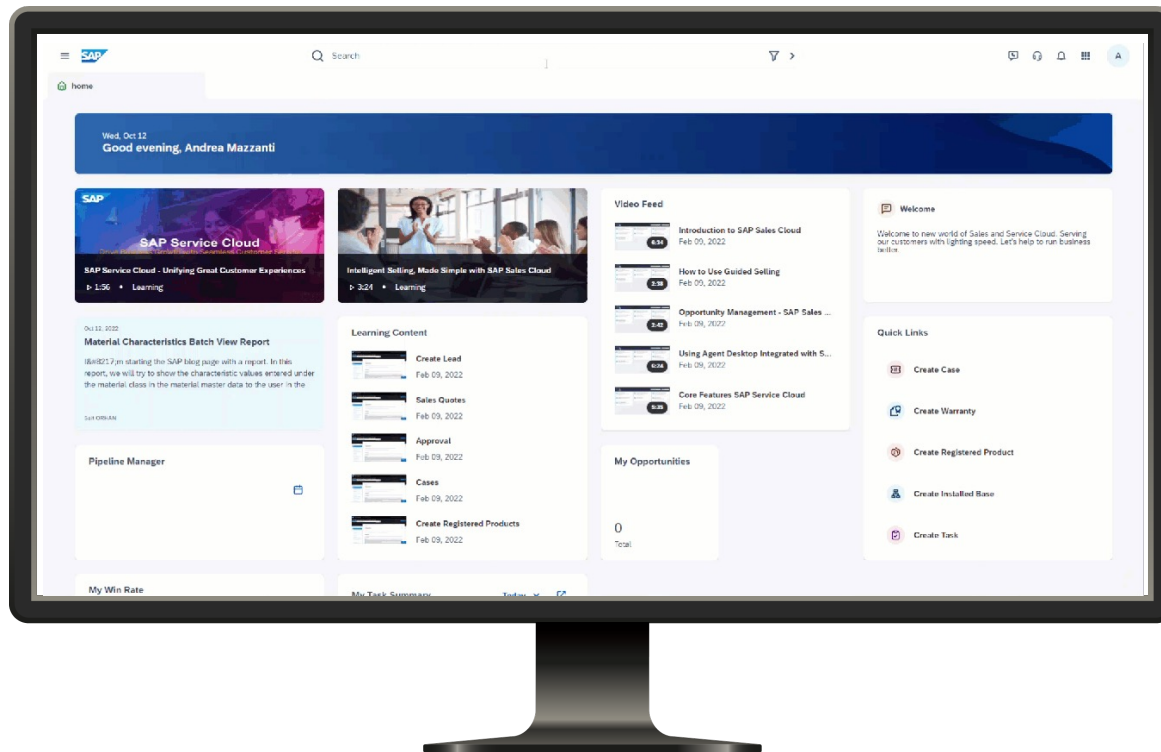

Account management capabilities gives you a holistic view of the customers, and allow you to capture, monitor, store, and track all critical business information about customers, prospects and partners.

In the system, the **Customers** refer to corporate accounts, individual customer accounts and contacts.

Accounts represent organizations with which business is done and **Individual Customers** represent persons with whom business is done.

Account

ADMIN users can configure what recommended actions, key metrics and type of interactions are displayed in the Account details page

- **Configure Customer Insights**
 - Highlights
 - Key Metrics
 - Timeline filters

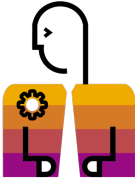

ADMIN users can also configure ABC classification (for example ABC classification could represent different group of Customers based on their Revenues) and Industries for Account and Individual Customers

- **Configure ABC Classifications**
- **Configure Industries**

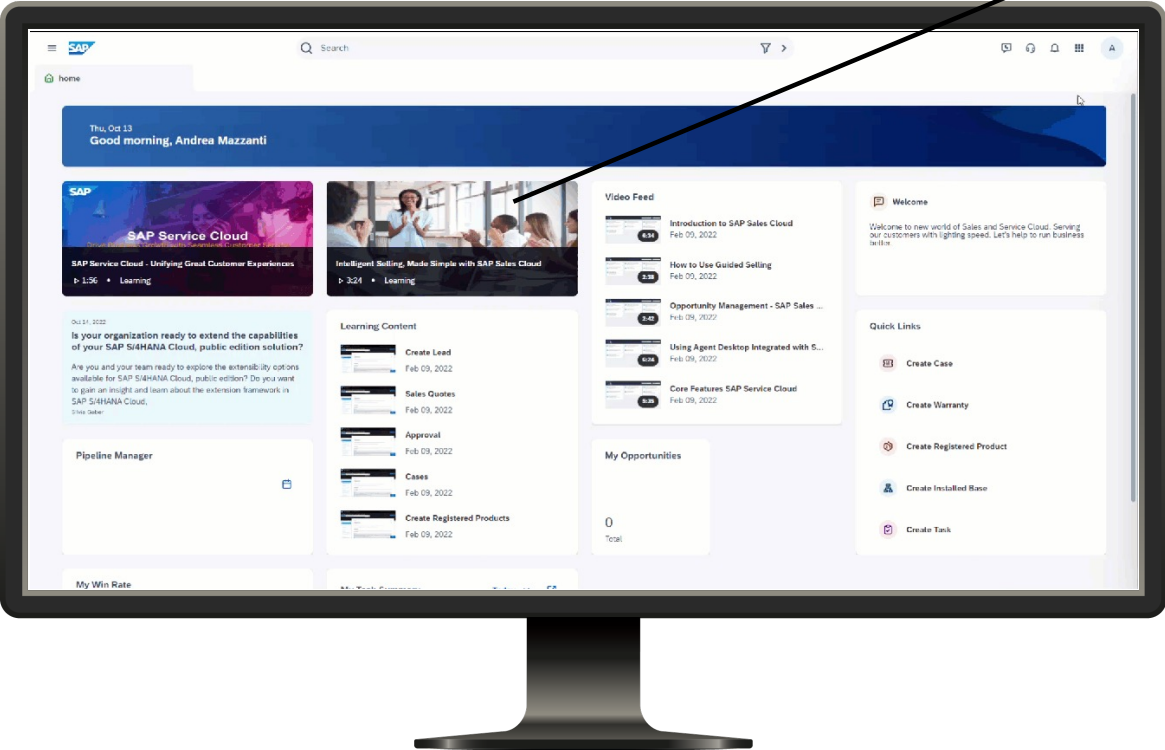

Products

CX

Products

Material 	Tangible product that can be created which then represents a business value. Can be traded, consumed or produced.
Service 	An intangible product that describes the provision of a service. Provided at the time of its use.
Entitlement 	A sellable product that describes the right to use a material of service.

Products

 **Product**

Units of Measure

Product Groups

Products

A **product** is the **item offered for sale** and it can be a **service** or a **physical item**. A product can be of real or virtual form.

Service Agents or Service Managers can easily maintain a product by adding products to Cases or assign products as a category for surveys.

As a service agent, you can work with products as a criterion for categorizing, routing, or analyzing the text of customer tickets and perform appropriate action.

ADMIN users can maintain the following in **User Menu -> Settings -> Product**

- Units of Measure
- Product Groups

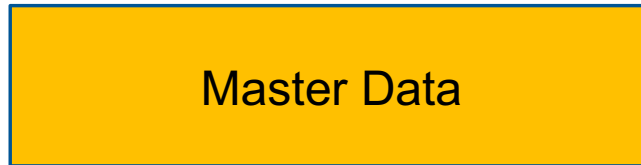

Show Examples:

- Organization

- Customer

- Contact

- Individual Customer

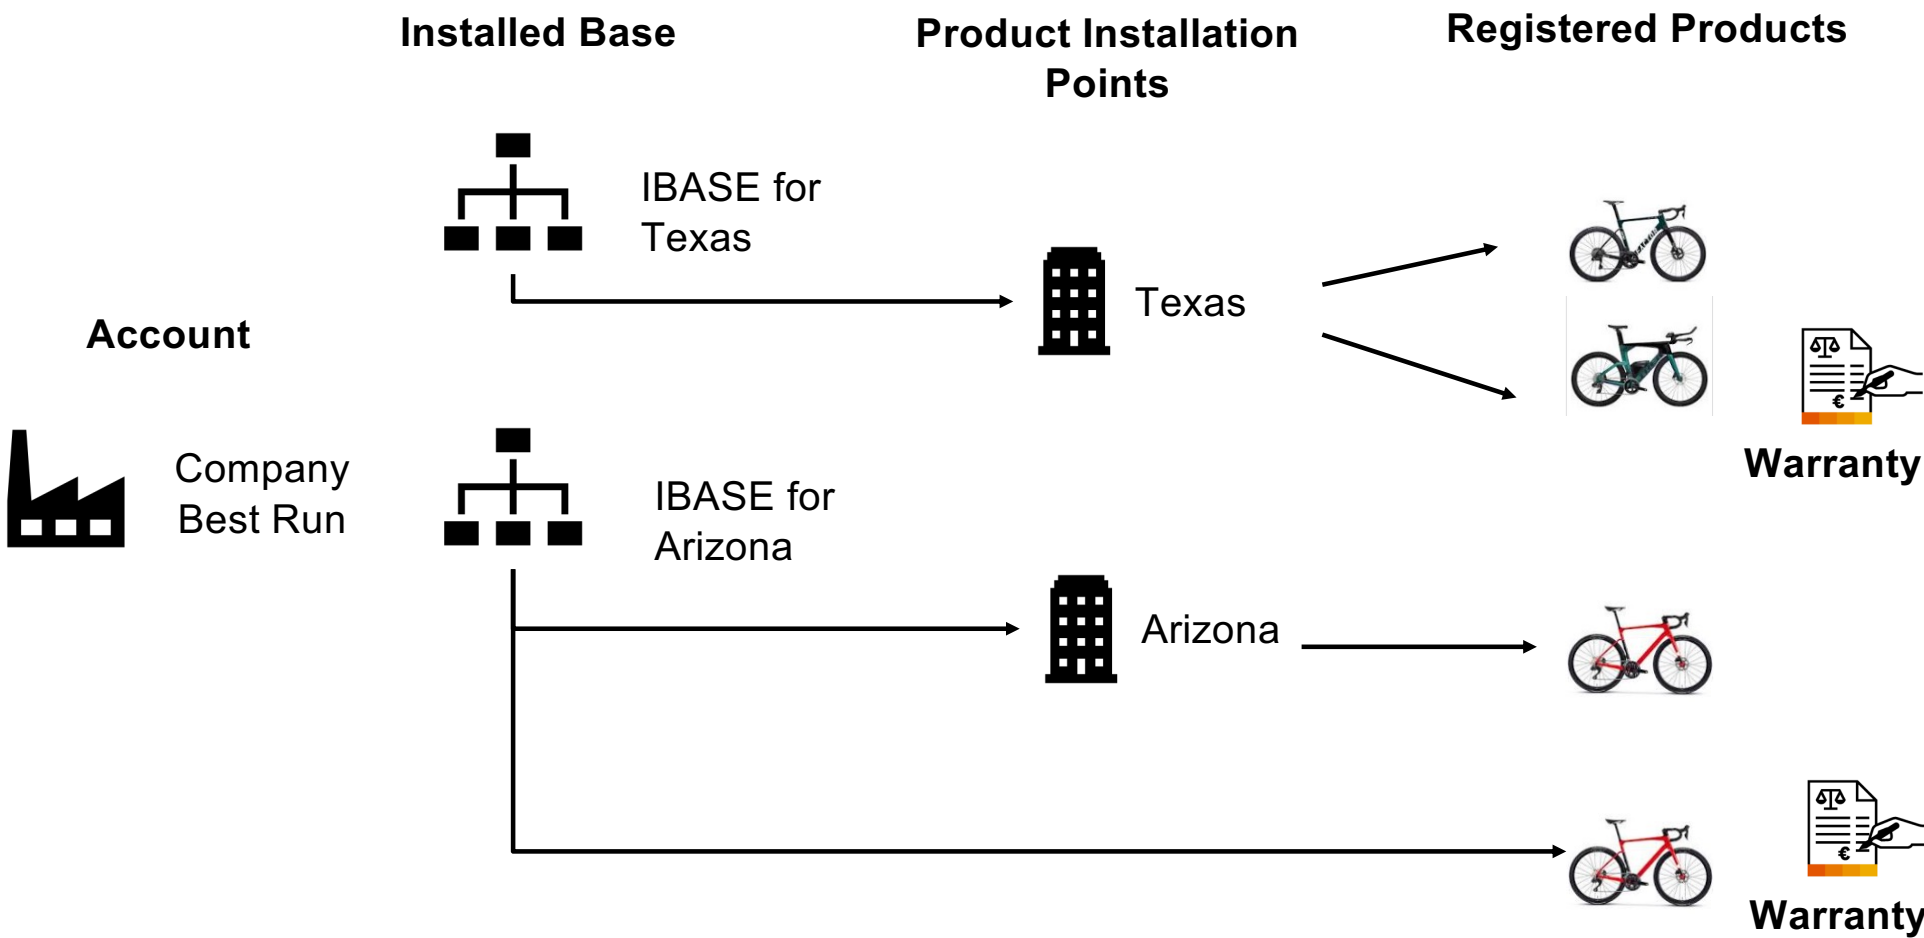

- Employees

- Product

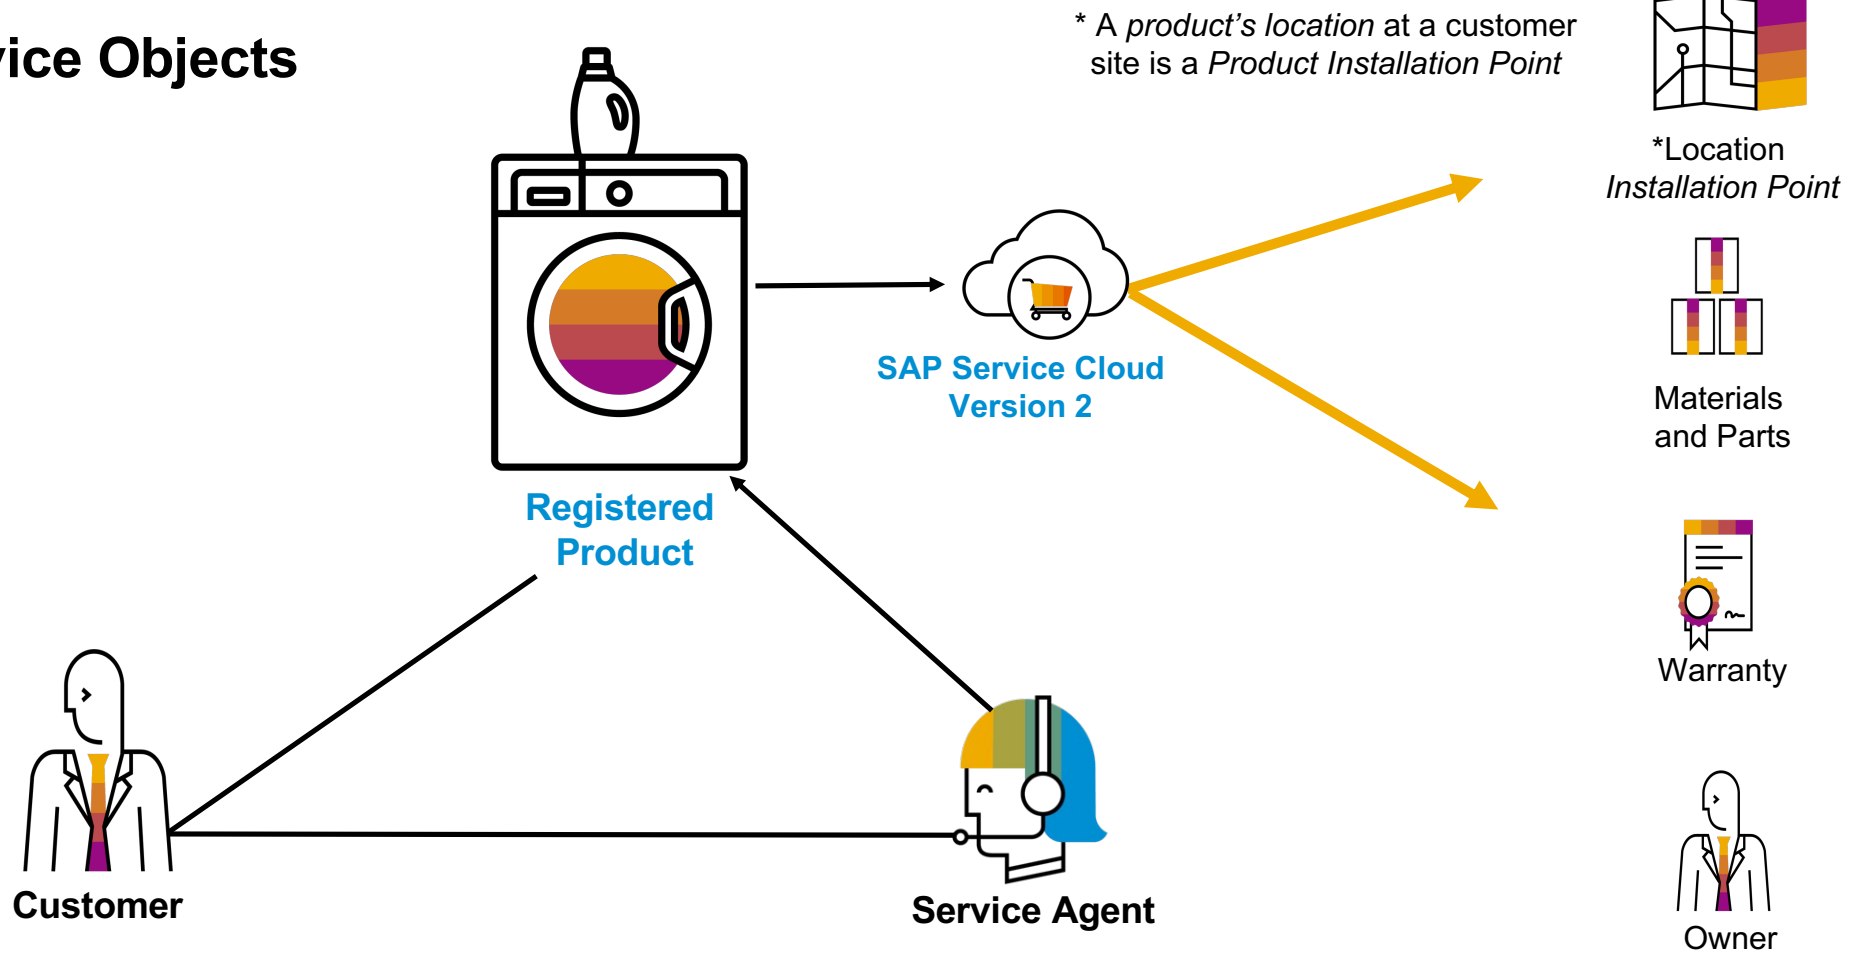

6) Service Objects

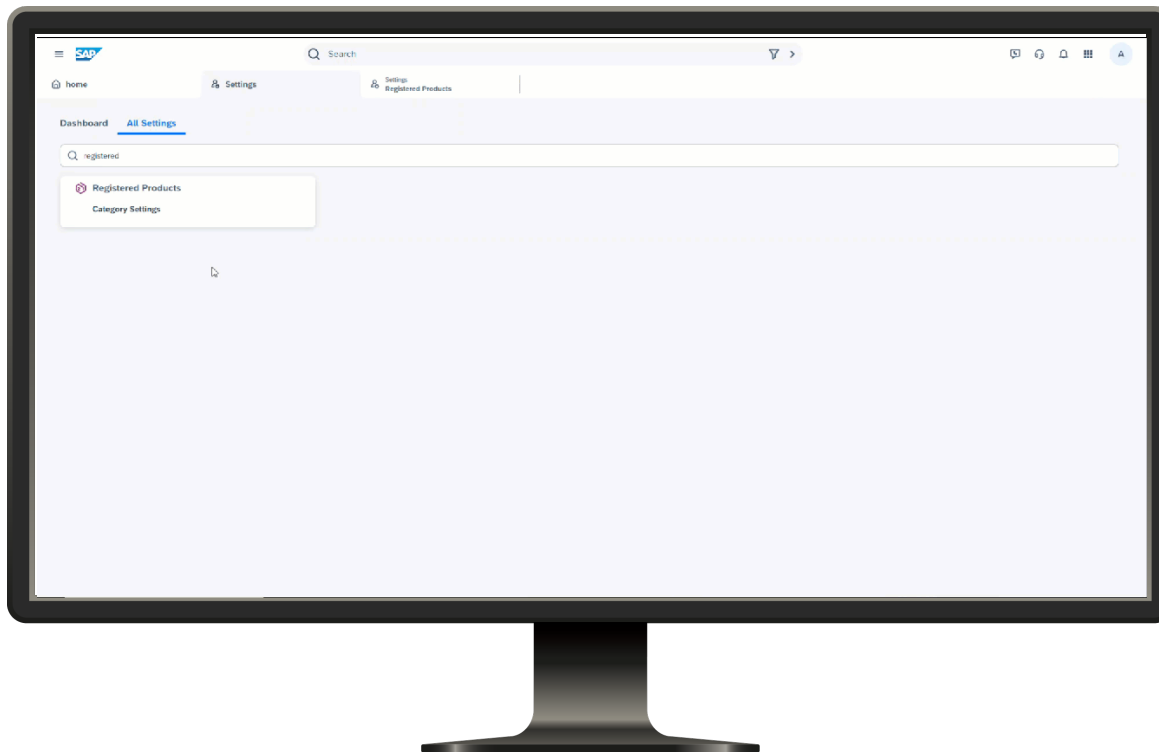

Service Objects

Service Objects

Registered Products

A **registered product** is an **instance** of a **product** that is associated with a specific customer and generally has a **serial number**.

When a ticket is created, the registered product information allows the service agent to identify the customer product and any associated warranties or service entitlements. Additional information, such as product location is used in the service process.

ADMIN users can configure what Categories of Registered Product are required in the system.

For example:

- Professional Coffee Machine
- Home Professional Coffee Machine
- Portable Coffee Machine

Registered Products – Case Creation

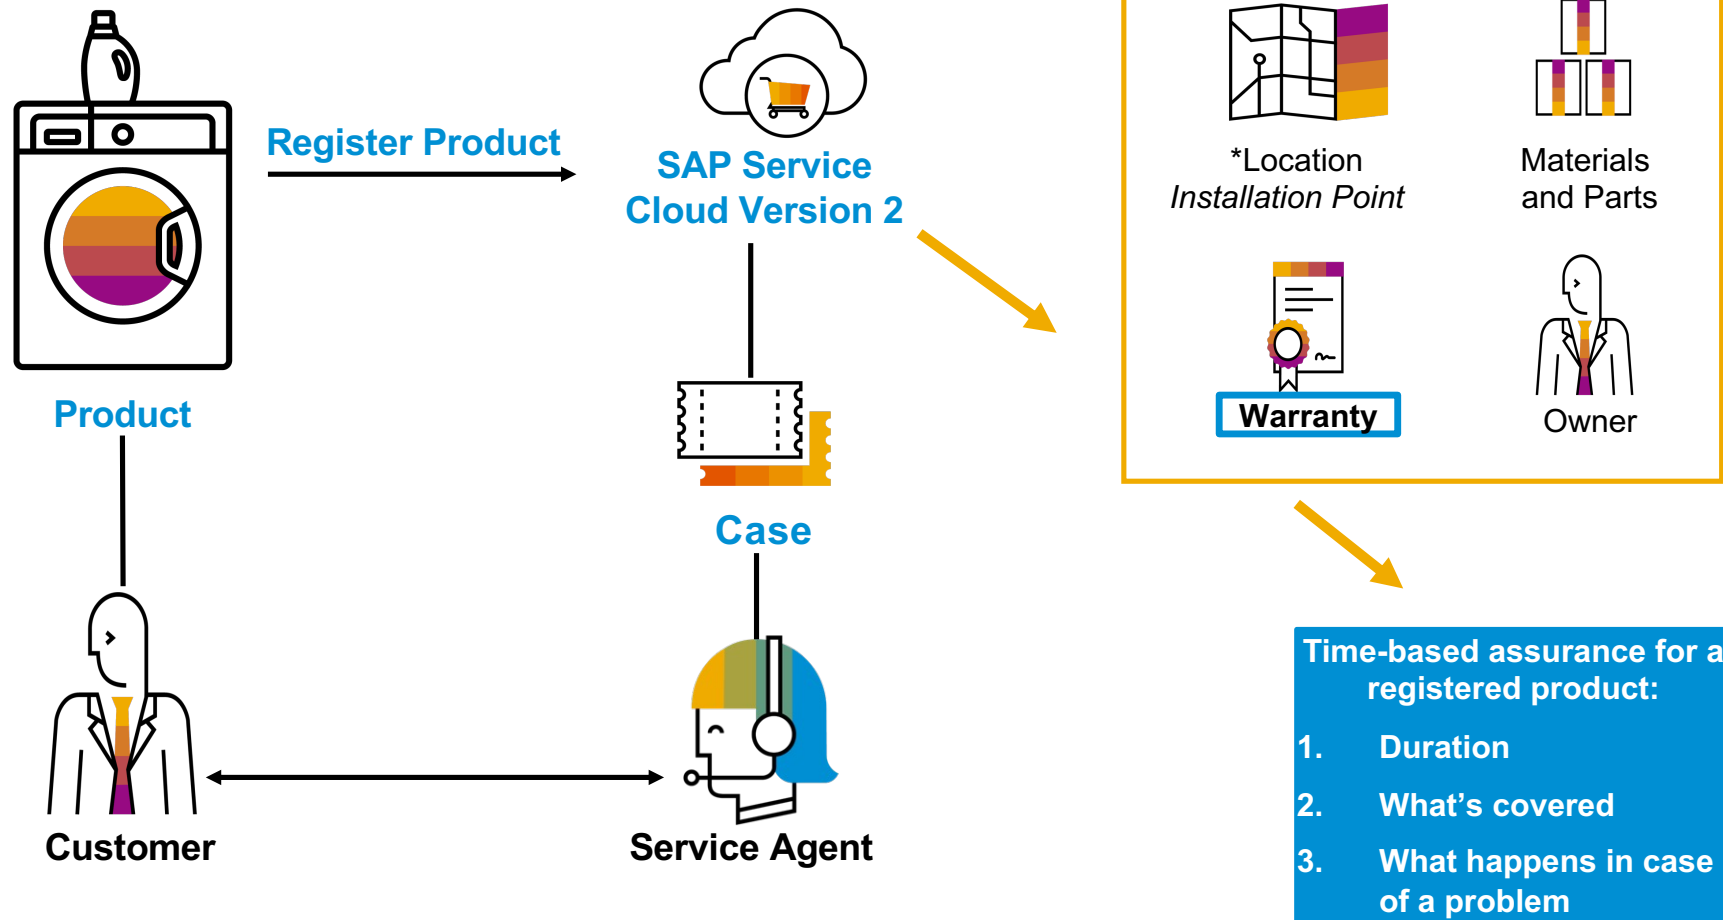

Ability to **create a case** for a Service Object such as a Registered Product directly from its master data facet 'Related Service Objects'

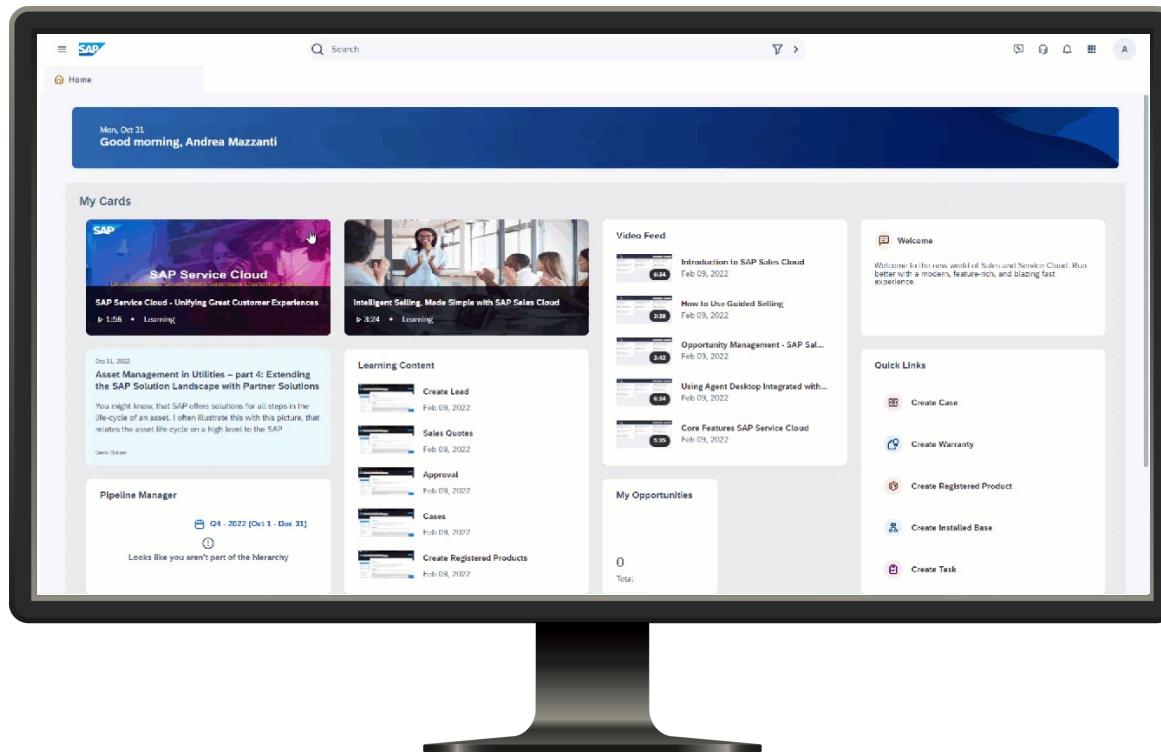

How to use it:

- Open Detail View 'Related Service Objects'
- Use action '+' to open case 'Quick create'
- Enter Case Type, Subject and Description...
- By Save the relating Case will appear in the list

Warranty

Warranty – Main Elements

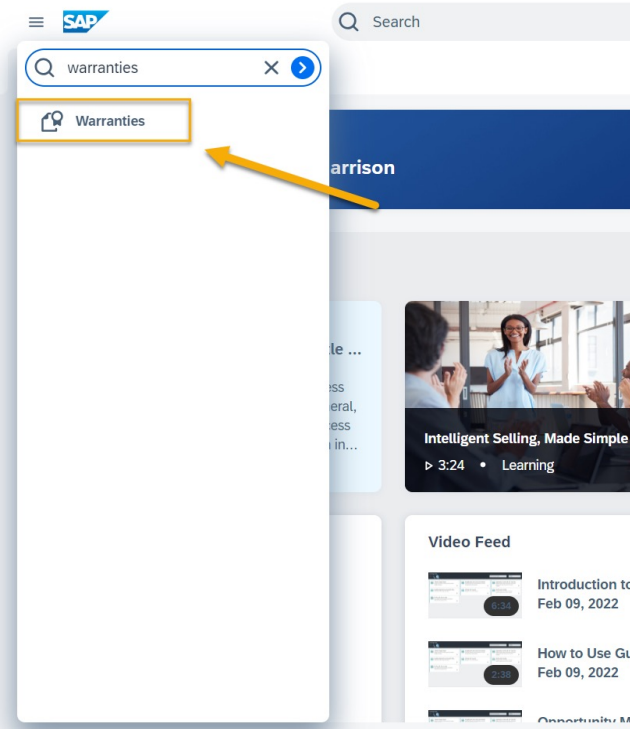

Users can assign a warranty to a registered product, or to a functional location, and determine its coverage when working on a Case.

When creating a new Warranty, users need to maintain:

- Name
- Duration

How to access Warranties

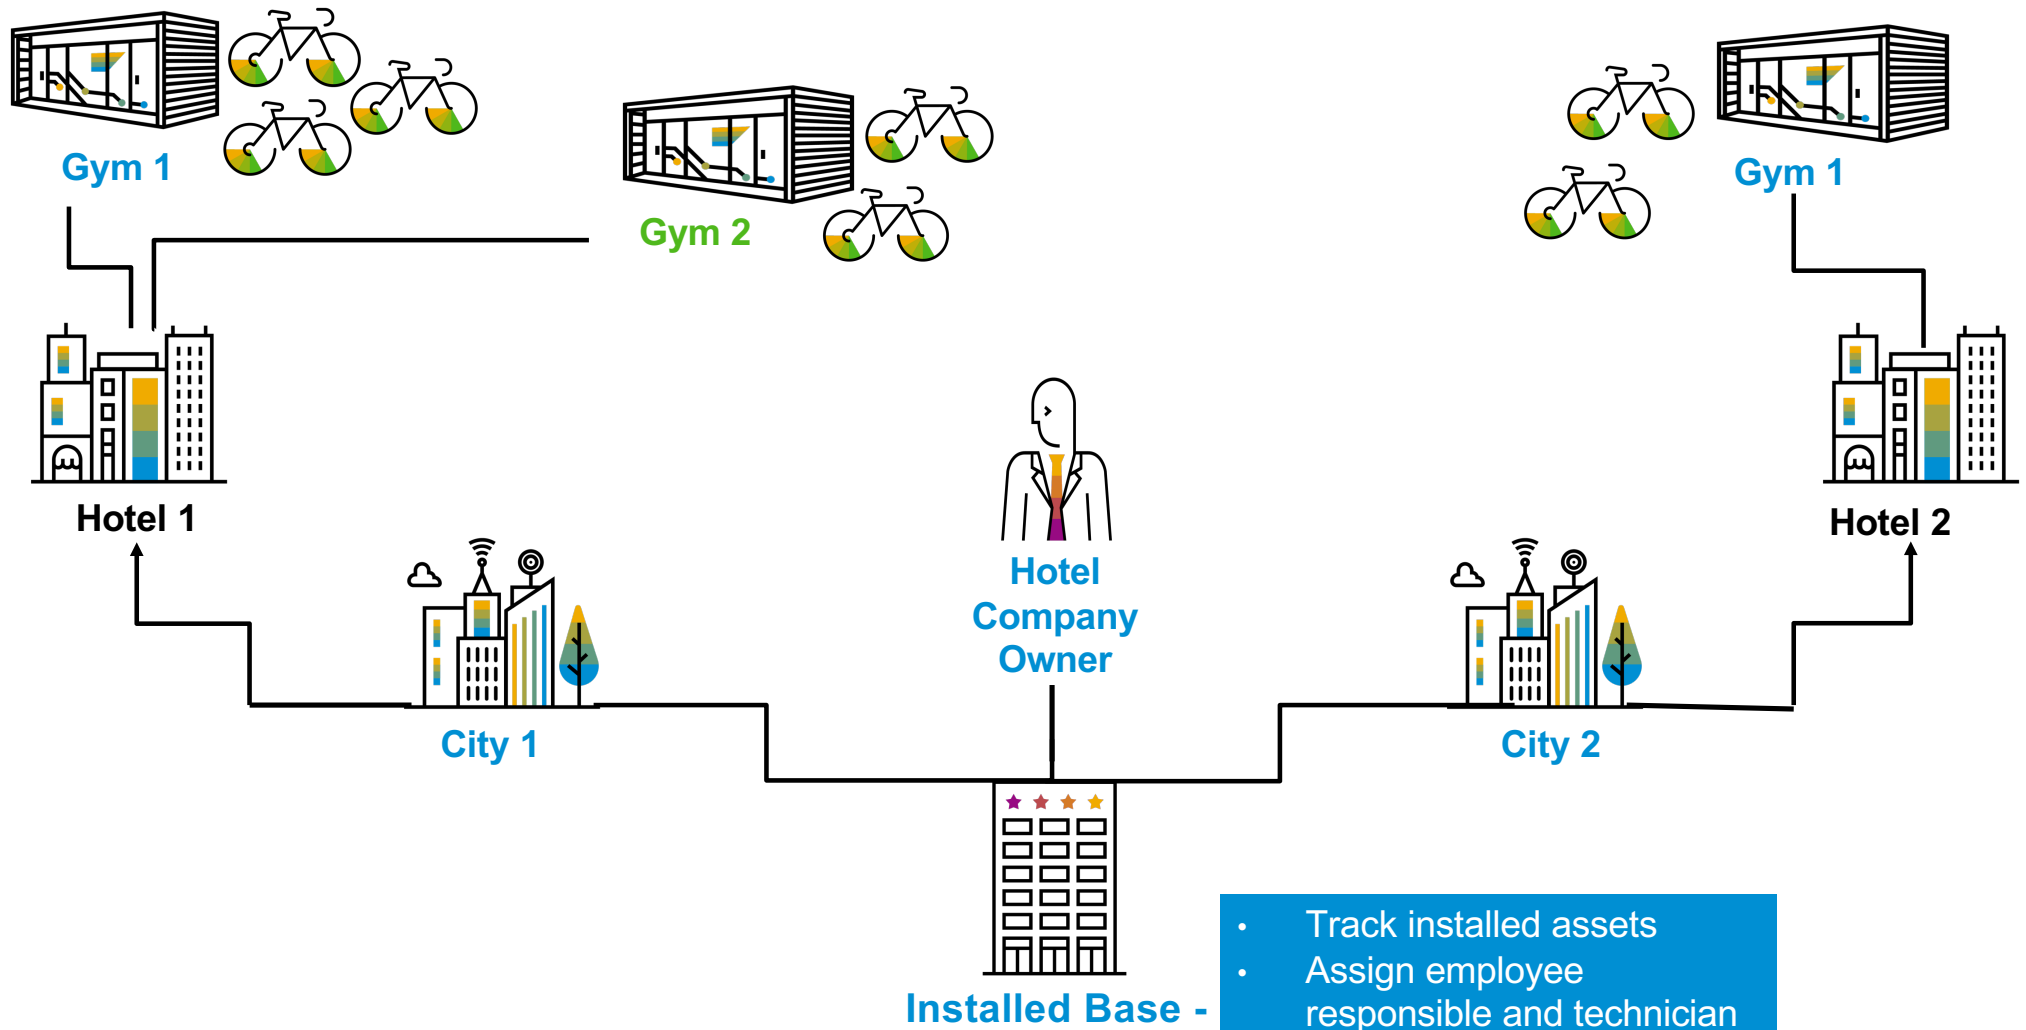

This screenshot shows the 'Warranties' app in SAP Fiori. The app displays a list of warranty records with columns for ID, Name, Status, and Duration. The records are as follows:

ID	Name	Status	Duration
7	10 Years Warranty	ACTIVE	10 years
1	3 Year Warranty	ACTIVE	3 years
6	5 Years Warranty	IN_PREPARATION	5 years
11	5 Years Warranty	ACTIVE	5 years

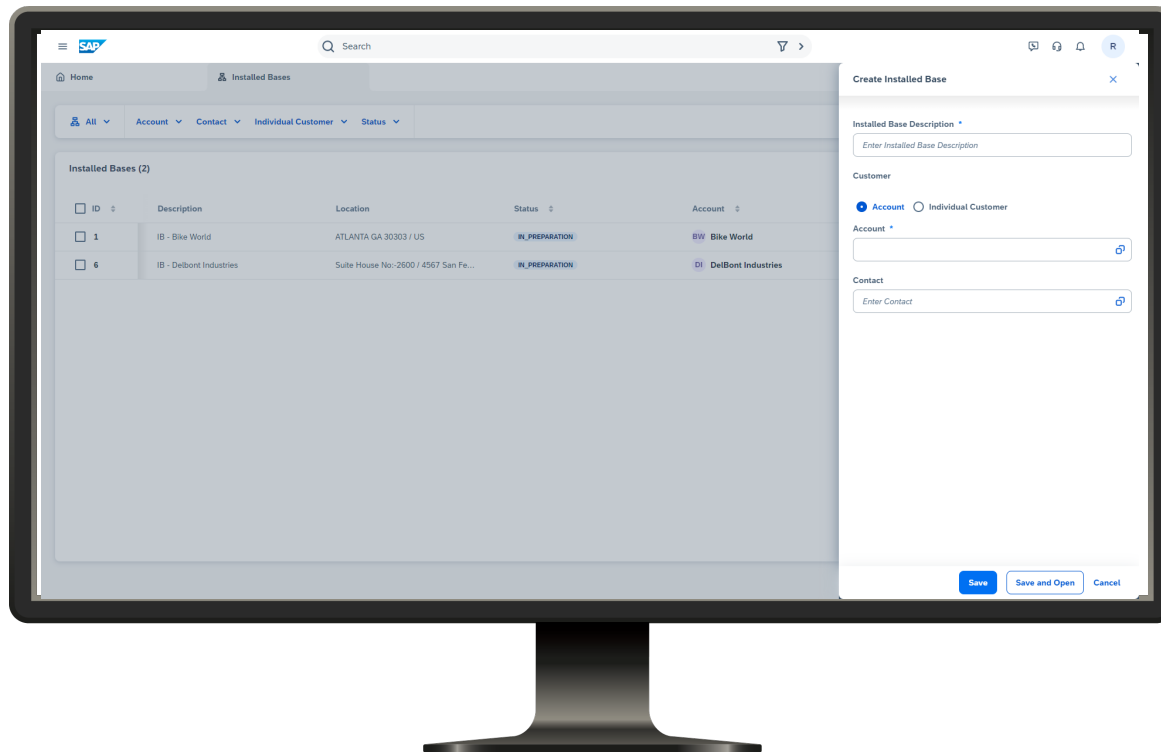

The app also includes a search bar at the top, a filter icon, and a pagination bar at the bottom showing page 1 of 1.

Registered Product and Warranty assignment

[illegible]

Installed Base

Installed base is a **hierarchical arrangement** of **items** installed at the customer's location.

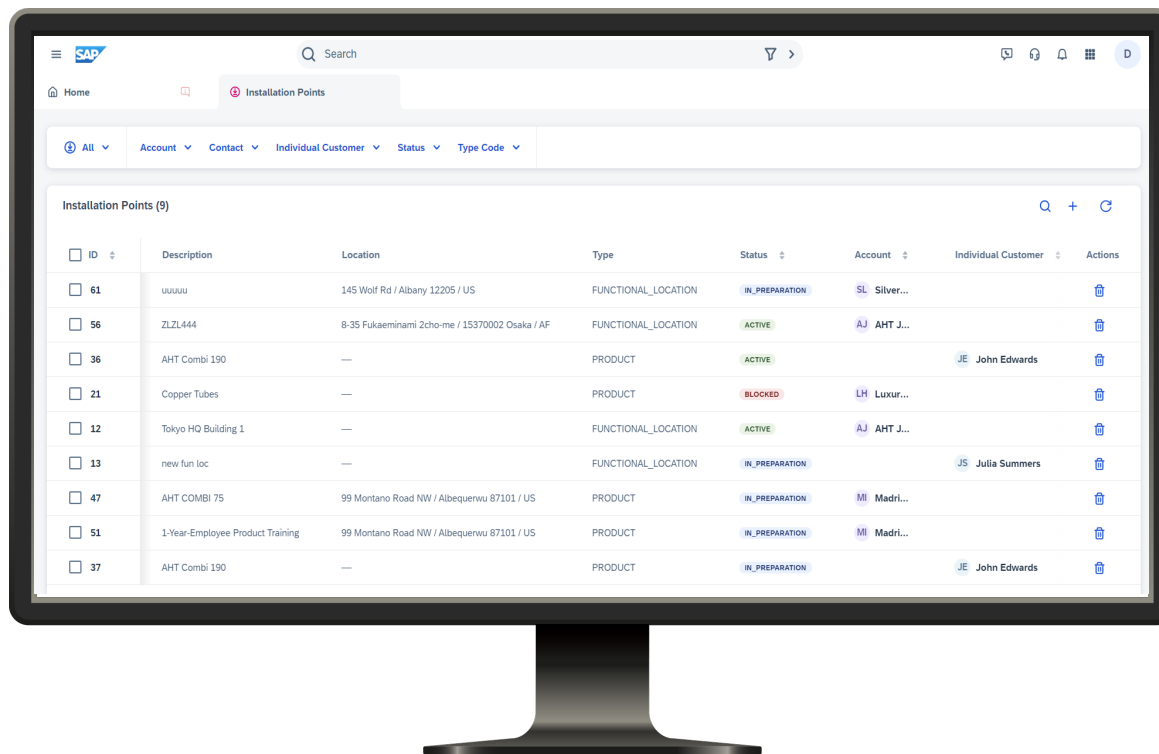

In the Installed Base work center, users can do the following:

- View the list of maintained installed bases.
- Get information about customer, contact, location, and status, and access an installed base
- Create new installed bases

Certain information can be maintained at the installed base header level. For example, Involved Parties, Attachments, Notes and Competitor Products.

The status of the installed base changes to In Preparation after it is saved.

View list of Maintained Installed Base

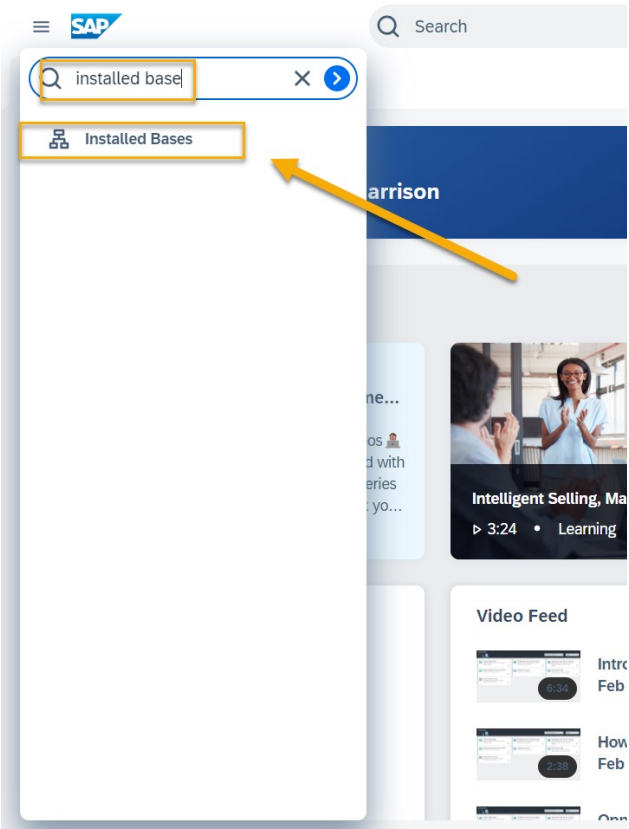

The screenshot shows the SAP S/4HANA 'Installation Points' list. The interface includes a search bar, filter tabs (All, Account, Contact, Individual Customer, Status, Type Code), and a table of 9 installation points. The table columns are ID, Description, Location, Type, Status, Account, Individual Customer, and Actions. The status column uses color-coded labels: IN_PREPARATION (blue), ACTIVE (green), and BLOCKED (red).

ID	Description	Location	Type	Status	Account	Individual Customer	Actions

Product Installation Point

A product installation point is the physical location of the object that requires servicing and maintenance. It also consists of product information for an installation point.

It consists of following specifications:

- Product
- Quantity
- Unit of Measure

You can create product installation point from other entities such as **Installed Base**, **Functional Location**, and **Registered Products**.
