Party Processing

Party Roles

Party RolesChangesDeletions

Party Roles display all standard party roles, such as Account, Contact of Account, Partner, and so on, and allows you to create custom party roles tailored to your business needs. You can also rename existing roles by modifying their descriptions.

While creating a new Party Role, ensure to select an appropriate **Party Category** and if needed, select the relevant **Relationship Type** and **Source Party**.

Party Category : Party category determines which type of parties are allowed for this role. It can be restricted to Employee Party, Contact Party, All Person Party, Account Party, or All Parties and so on.

Relationship Type and Source Party: If the party is related to another party, then it is important to maintain an appropriate relationship type along with source party.

Example: Creating a custom party role - **Distributor of an Account**. You'd create a new role as Distributor with **Party Category** as **Custom All Parties** Then, choose a relevant **directed Relationship Type** (e.g., Has Distributor) and select the Source Party as **Account**.

When you assign a party role to a relevant transaction entity's Party Schema, then **Distributor of an Account** is determined in the transaction document based on the party role configuration.

Note: **Source Party** may be a standard Party Role or custom defined one.

Party Role Assignments (11)

Changes

Active	Party Role	Determination Context	Actions
	521 - Trusted Authorization Unit	Party	 
	1001 - Account	Party	 
	591 - Account Contact	Party	 
	214 - Reporter	Party	 
	40 - Processor	Party	 
	28 - Service and Support Team	Party	 

The Party Schema shows all the party roles assigned to a selected transaction and allows you to edit or assign custom party roles. Each transaction comes with a default party schema and its assigned party roles, but you can customize it by adding custom party roles and activating it or deactivating the roles you don't need.

Party Roles Assignment: Standard party roles (for example, Bill-to Party, Ship-to Party, Contact Person and so on) are already assigned to the schema. You can also add custom roles or deactivate existing roles which are not needed. Assigned Active party roles determines which parties are involved in the transaction like organizational unit, territory, account, etc.

Mandatory: You can mark the assigned role as mandatory or optional. This means that mandatory roles must be involved in the transaction.

Unique: You can also allow multiple parties to share the same role (for example, several contacts on one transaction document) or enforce that only one party can fill the role.

Determination Steps: Use the Action button next to a role to view its determination steps. There is a sequence of determination steps and the system tries to find the party based on sequence; if it doesn't find a match, it moves to the next step, and so on, until the relevant party is determined for that role. You can activate or deactivate individual steps to control the determination.

Party Schema

The Party Schema shows all the party roles assigned to a selected transaction and allows you to edit or assign custom party roles. Each transaction comes with a default party schema and its assigned party roles, but you can customize it by adding custom party roles and activating it or deactivating the roles you don't need.

Party Roles Assignment: Standard party roles (for example, Bill-to Party, Ship-to Party, Contact Person and so on) are already assigned to the schema. You can also add custom roles or deactivate existing roles which are not needed. Assigned Active party roles determines which parties are involved in the transaction like organizational unit, territory, account, etc.

Mandatory: You can mark the assigned role as mandatory or optional. This means that mandatory roles must be involved in the transaction.

Unique: You can also allow multiple parties to share the same role (for example, several contacts on one transaction document) or enforce that only one party can fill the role.

Determination Steps: Use the Action button next to a role to view its determination steps. There is a sequence of determination steps and the system tries to find the party based on sequence; if it doesn't find a match, it moves to the next step, and so on, until the relevant party is determined for that role. You can activate or deactivate individual steps to control the determination.
